Toronto, Ont., M4E-2E2
CANADA

To:

9T9

9T9 USERS GROUP EXECUTIVE COMMITTEE

PRESIDENT Steve Mickelson (657-1494)
VICE-PRESIDENT Neil Allen (255-8606)
SECRETARY/MEMBERSHPS Randy Rossetto (469-3468)
TREASURER/OFFICER AT LARGE Cecil Chin (671-2052)

LIBRARY DIRECTORS

Gary Bowser (960-0925)
Andy Parkinson (275-4427)
Steve Findlay (416) 727-6807
Erik Wiklund (416)827-4858

NEWSLETTER EDITOR

Steve Mickelson (657-1494)

MEMBERSHIP FEES

FULL MEMBERSHIP..... \$30.00 / year
NEWSLETTER SUBSCRIPTION \$20.00 / year
DISK OF THE MONTH subscription,add... \$30.00 / year
(Delphi Memberships add \$3.00 for credit card fees)

All memberships are household memberships. A newsletter subscription is only for those who do not wish to attend meeting, but wish to receive our newsletter and have access to our library. You are welcome to visit one of our general meetings before joining the group. If you wish more information contact either our president, in writing, at the club address on the front cover or phone him.

The meetings are usually held on the last Thursday of each month, (exceptions are December's meeting date, usually mid-month and the months of July and August, when there are no meetings. Consult this issue of Newsletter 9T9 for the date and time of the next meeting. Meetings are usually held in the lecture room main, at Canada Remote Systems, 1331 Crestlawn Dr., Unit D, Mississauga, (Eglinton Ave./Dixie Road Area), from 7:30 - 10:30 PM.

BBS

The 9T9 Users Group supports the Toronto BBS, The TI Tower BBS # (416) 921-2731, 300/1200/2400 BPS, 24 hrs. Sysop. Gary Bowser.

MAILING ADDRESS:

9T9 Users Group, 109-2356 Gerrard SEast, Toronto, Ont. M4E-2E2, Canada

COMMERCIAL ADVERTISING

Any business wishing to reach our membership may advertise in our newsletter.

The rates are as follows. (width by height):

FULL PAGE (7" x 10") \$30.00

HALF PAGE (7" x 5") \$15.00

QUARTER PAGE (7" x 2 1/2") \$ 7.50

Please have your ad's camera ready and paid for in advance. For more information contact the editor. Don't forget, that any member wishing to place ads, may do so free of charge as long as they are not involved in a commercial enterprise.

NEWSLETTER ARTICLES

Members are encouraged to contribute to the newsletter in the form of articles, mini programs, helpful tips, hardware modifications, jokes, cartoons and questions. Any article may be submitted in any form by mail or modem. We welcome the reprinting of any article appearing in this newsletter providing credit is given to the author and 9T9. If more information is required, call the editor. The names, 9T9, Nine-T-Nine, Newsletter 9T9, 9T9 Users Group, and Nine-T-Nine Users Group are Copyright(c), 1982,1983,1984,1985,1986,1987,1988,1989,1990, by the 9T9 Users Group of Toronto, Canada, all rights reserved.

DISCLAIMER

Opinions expressed in this newsletter are those of the writers and are not necessarily those of the 9T9 USERS' GROUP. 9T9 cannot assume liability for errors or omissions in articles, programs or advertisements. Any hardware modification or project is presented for informational purposes, and the author, newsletter editor, staff and/or 9T9 Users Group & cannot be held liable for any damage to the user's equipment. All such projects are done at your own risk!

TIdbits

#39

-By Steve Mickelson, President 9T9 Users Group
Compuserve 76545,1255; Delphi SMICKELSON; GENIE S.Mickelson

Club News:

Because of various conflicts and problems with work and personal schedules our last couple of meetings were more like small socials rather than meetings per se. You can expect a better organized, more eventful set of meetings in the next couple of month's. Thanks to Gary Bowser my Geneve is back on-line, I'm in the process of updating my software and re-learning use of the Geneve. Thanks, also, to Barry Boone, who completed my order for his Giffy software, (check back a couple of issues for details re: how to order). Included with the software was a converter program for the Imagewise Digitizer, (to GIF format?). I have yet to try out the software and hope to give a demo in the June meeting of Giffy V, as well as the Imagewise digitizer.

Mail call:

Recently, we were asked about the fact that the Disk Of The Month's advertisement, when published in the newsletter was always a month or so behind the D.O.M. included with that issue. The question was why not have the ad with the contents of the D.O.M. for the issue in which it was sent?

The answer is that Andy works on a deadline, much the same as what I do as far as publishing is concerned. Many times he receives an updated release or newer version of one or more of the programs included within the disk, just before the meeting date. Therefore the master disk is automatically updated. Many of the shareware programs, such as Disk Utilities and Funelwiter, have many radical changes in each release, that the description for an earlier release would be inaccurate, if applied to the current release.

And lastly, the documentation for operation of the software comes as a doc file on the disk and/or instruction screens displayed on the screen or available by way of a help or "hot key". The idea behind the ad, is to let members who missed the previous month's meeting know what they missed, as well as to inform subscribers to the newsletter only, know what can be ordered from the club's library, in the way of new releases.

And Mike's Butterfingers repair article, received some response, from GENIE mail:

Item 4757861 90/04/11 21:25
From: L.TIPPETT Larry E. Tippett
To: S.MICKELSON Steve Mickelson

Sub: THE ARTICLE

I called Mike myself the other night. I found his phone number in the text. He wasn't in at that time, but returned my call later on that night. It seems that he is requesting info on hooking up disk drives. (not to mention taking them apart.)

I told him that I had some info for him I got from the GM TRAINING CENTER I attended from time to time. I also have the RADIO SHACK book I mentioned. I told Mike that I will mail it to him as soon as I get a chance. One of the instructors at the center, (Who I talked with just today.) is mailing me all the info he has on the matter too. (He builds computers for somebody.) anyway... Thanks for responding, but I have already talked with Mike, and I'm on top of the situation. I have his address here somewhere... I think!
Be talking to you again sometime.....

Larry Tippett
=END=

Just received a call from Tom Jakabfy, president of OSHTI, who asked for the local Tymnet node to access and sign-on to Delphi. Tom said he may drop in our June meeting. Also, related how he now has both a Rave keyboard and Zeno board projects under his belt. I have one of each yet to be constructed, and that I may be giving him a call when sourcing parts for the Zeno Board. I don't think that either could be any more difficult to construct than the Imagewise kit was. It is just a matter of finding the time. I hope to be able to put the TI mother board, the microexpansion system, small black and white t.v., and double DS/DD disk drives, which constitute my "portable" system described earlier into the empty case of a clone, I purchased from Active surplus, for \$20.00. The case I bought was empty, save for a detachable keyboard. It has the space for two half-height drives as well as other components. I figure if I put the mother board, with a Zeno board and rave keyboard interface, and the microexpansion system, drives T.V. and all inside of this case. This would put all of the above within a case about 2/3 the size of the TI P-Box, including keyboard. The keyboard's "enter" key has to be repaired first. Anyway that's a summer break project.

New Expansion System:

If you read the Tales of a Power Supply article, in this issue of the newsletter, you'll find an interesting alternative to upgrading the regulators of the TI power supply. Speaking of expansion systems, Rave has introduced a new expansion system for the TI community. It comes in two versions, for the TI and Geneve. Both versions permit housing a hard drive and cards, but the exciting news is that the TI motherboard, when connected to Rave keyboard interface and IBM keyboard, can be placed inside this expansion box! I think this has the makings of a great expansion alternative.

Software updates:

TI Base users please note that Texaments has upgraded TI Base, I hope to have more details for the next newsletter.

Last month's newsletter:

Readers who tried out the examples from Assembly Made Easy, may have found it hard to run them. If you haven't already found out all examples which have a double at sign, @@, should use only a single @. The example was written for TI writer, which prints the double @ as a single.

Also, Kelly Mauricette, announced that his weekend BBS, is now running at 2400BPS.

Anyway I'm out of time and space for this month's Tidbits.

The makers of TI Artist are proud to introduce the most powerful and comprehensive graphics development system available for the TI-99/4a Home Computer...

TI Artist Plus!

More than just an ordinary drawing package, TI Artist PLUS! is a complete drawing system that consists of six dynamic graphics development modules. With these modules, virtually anyone can create, edit, transform, and present the most dazzling of graphics. And with its innovative point-and-shoot menu system, TI Artist PLUS! is extremely user friendly.

Drawing Module

With 8 different brushes, 10 fill patterns, and 16 available colors, almost any picture can be created using TI Artist's drawing tools. Freehand drawing, automatic point-to-point lines, shooting rays, boxing, circling, filling, mirroring, zooming, and spray painting are all a snap! Variable arcs and ellipses can also be drawn with ease. Any picture you design may be saved to disk and later recalled for viewing and modification.

Enhancement Module

Cutting, pasting, copying, importing and exporting graphics is easy with TI Artist PLUS!. Small images, called instances, and collections of small images, called slides, may be used to enhance your artwork. Instances and slides can be created, saved to disk, and used over and over again in all of your drawings. And if you wish, you could also purchase small collections of various (pre-drawn) graphics artwork to use.

Only \$24.95
(Plus Shipping)

Print Module

With TI Artist PLUS! 1 to 3 pictures can be simultaneously printed together (or separated) across a standard 8.5" x 11" sheet of paper. Print options include: printing in portrait or landscape mode, printing in high or low density, redirecting output to a disk file, printing an outline around a picture, and printing a reverse image of a picture. TI Artist PLUS! supports most popular printers and a limited number of color printers.

Vector Module

Selected areas of a picture can be scaled using TI Artist PLUS!. With scaling, a section of your picture can be made larger or smaller; the height and width of an object can be varied independently. Special effects can also be used to enhance selected areas of a picture. They allow the horizontal and vertical parts of an image to be scaled along a range. Objects can be tilted and shifted using various pre-defined special effects.

Font Module

The font module is used to place alphanumeric data anywhere within a picture. Detailed bit-mapped fonts (available in numerous Artist Companion products) may be used to label a drawing, create a sign, and so on. Features available in the font module include: multiline text editing, automatic outlining of fonts, automatic shadowing of fonts, and automatic left, right and center text positioning.

Movie Module

Animated movie sequences can be produced with TI Artist PLUS!. A small interpreted command language allows you to design an animated sequence using your own pictures and artwork. The command language consists of 8 simple instructions, including a handy indexing command that will display a directory of all your TI Artist files. Movies may be saved to and later played from disk.

Upgrade to TI Artist PLUS!

Owners of the original TI Artist may obtain TI Artist PLUS! for only \$14.95 (plus shipping). To be eligible for the reduced rate, return your original TI Artist disk and the front page of your existing TI Artist manual along with the upgrade fee.

TI Artist PLUS! requires a disk system, 32K, and either an XB, E/A, or MM cartridge. TI Artist PLUS! is compatible with the Geneve 9640 (in GPL mode), and the Myarc hard disk controller. TI Artist PLUS! supports the following printers: Epson, Prowriter, IBM Graphics Printer, SeikoSho GP-100/100TL/550/700, Oudata 92/93, Star NX-1000 Rainbow, and Canon PJ1080A, and Tandy CGP220.

TEXAMENTS

Office: (516)475-3480 53 Center Street, Patchogue, NY 11772 BBS:(516)475-6463

Please add the following shipping charges to your order: \$2.50 for domestic first class delivery, \$8.00 for foreign insured air mail delivery. Orders are usually shipped within a 48 hour period. All C.O.D. orders must be placed by phone. Sorry, no credit card orders will be accepted.

The DB-9 to DB-15 Connection

-By Steve Mickelson, 9T9 U.G., Toronto

It has come to my attention that many users of 80 column cards, which use the TI 9938 Video Display Processor chip, are having difficulty determining which monitor to use, as well as how to wire a cable from the monitor to the card. Since the introduction of these cards, namely the Myarc Geneve as well Digit's and Mechatronic's, (Asgard's) 80-column display cards, the finalized VGA graphic standard set for users of IBM computers and their clones has been set to that of a relatively new connector; the DB-15 plug, a 15-pin plug, which replaces the 9-pin, DB-9 plug.

In the past articles re: making a cable for your 9938-based card, was restricted to the DB-9 plug, as early VGA and multisync monitors used this type of connector. The advent of the DB-15, makes it necessary to update such articles. Therefore, I present this article which is a composite, the first part from Delphi and the second part, namely how to connect to the new style DB-15 connector.

But first a few caveats:

When looking for a monitor, make sure that it is classified as an "analog" or "multisync VGA", not digital or TTL type. Generally speaking, the 9938 maximum screen size is 512 (w) x 212 (h), so a monitor of this pixel rating or higher, [eg. 640 (w) x 480 (h)]. While an analog VGA monitor may seem to fit the bill, as far as the video display is concerned, the Myarc 9640, for example has a horizontal scan rate in the 15 KHz range, which more in line with the IBM EGA display adapter, when the adapter is run in in CGA mode, when in EGA mode, the EGA adapter's horizontal scan rate goes up from 15.750KHz (CGA mode) to 22.000KHz (EGA) mode. An IBM VGA display adapter, uses a Horizontal scan rate of 31.500KHz, and the new PS/2 or 8514 adapter, also termed "super vga" uses a horizontal scan rate of 31.500KHz, with a screen size of 640 x 480 and 1024 x 768. While the screen size of a VGA or 8514 adapter can handle the output of the 9938, the horizontal scan rate is most likely too high for the monitor to "lock on" to the cards output. Which brings us to the analog mutisync monitor.

This monitor can be used with all variety of cards, including the EGA horizontal scan rate, with a 640 x 480 screen size, which makes the monitor compatible with early "VGA" video cards, (before the standard was released), and 9938 cards as well! A regular EGA monitor won't work, as it uses a TTL or digital signal, which our video card can't provide without some additional driver circuitry.

Since it now appears that an analog multisync monitor is what we are looking for, brings us to the third concern, namely some monitors may have more than one input connector. The Goldstar multisync has both a DB-9 and DB-15 connector, and is sold with a video cable which has a DB-9 on one end of the cable and a DB-15, on the other. If you connect the monitor to a VGA video source, you plug the DB-15 end into the video card's output and the DB-9 end into the corresponding plug of the monitor. For a EGA card, the cable is simply reversed; the DB-9 is plugged into the video card and the DB-15 end is plugged into the monitor. In this case, therefore, the monitors plugs are reversed from standard, wherby Goldstar uses DB-9, for VGA, and DB-15, for EGA!

Generally speaking, the VGA connector on a multisync with more than one connectors, uses the DB-15 plug for a VGA source. Be sure to read the spec's!

Yet, Another Geneve Cable Article!

-By Steve Mickelson, Toronto 9T9 Users Group

This article is for purposes of information only, the author and publication cannot be held liable for any damage as a result of attempting this project. If you use a composite monitor with your 99/4A, and will continue to do so on the Geneve, then ignore this article and just plug the same cable used on the 99/4A, without modification.

Although the Geneve monitor has been covered elsewhere, I think that this article will enhance articles published to date. The part numbers shown should be good both in the U.S. and in Canada. Numbers, (henceforth referred to as RS#), will be the same for Geneve owners, elsewhere. This article describes making a monitor cable for connecting the Geneve to a monitor, (e.g. Magnavox or Thompson), which has a D-style, 9-pin input connector, commonly used on IBM systems, (check your for type of connector and correct pin-outs). The cable described here, is specifically wired for a Magnavox Pro Monitor, (model 8CMB73), and Thomson, (model 4120), hi-res. monitors, both have RGB inputs using a 9-Pin connector, with a RCA input for audio.

Parts List:

Description	RS #
1-Tandy Keyboard Extension Cable	26-1389
*1-9-Pin D-plug, female(DB-9)	276-1538
1-9-Pin D-plug hood/hardware	276-1539
1-Shielded RCA phono patch cord	42-2351

*Depending on the type of monitor, you may have to substitute a 9-Pin D-plug, male RS# 276-1537

**This item may be found cheaper elsewhere, or one package split between two-thrifty or even four-frugal Geneve owners.

Tools required:

Pliers, wire cutters, wire strippers, low wattage soldering iron, solder, and electrical tape.

Instead of using the non-shielded 3m/10ft. Archer Joystick extension harness, (RS# 276-1978), which has no shield and may generate herringbone patterns, (v- or s-shaped lines), on the monitor's screen; I used the Tandy 1.5m/5ft. Keyboard Extension Cable for the Tandy 1000, (RS# 26-1389). Note: This item is a "special order" item at many stores and may only be available from Tandy Computer Centres.

The Tandy cable has a couple of advantages; it is shielded and is already soldered to the hard-to-find / difficult-to-solder 8-pin DIN plug used for video output on the Geneve. Also, the DIN plug has deeper recesses on the solder-side, making for easier soldering than the ARMACO DD 8280, as suggested in other articles. As only two wires have to be re-located on the DIN plug, most of the difficult soldering has already been done by the folks at Tandy.

Let's begin:

First, cut off and remove the female-end of the RS# 26-1389 cable. On the male-end of the cable, the plastic sleeve must be pulled back by pushing the metal tab with a small screwdriver, at the same time pulling the sleeve away from the pin side of the plug. Using a soldering iron, two wires must be desoldered and re-located as indicated:

Pin#	Wire Colour	Function	Relocated?	Pin#	Function
* 1	White	RF Mod.	Yes, to -->	8	Comp.Sync
2	Yellow	Ground	No	N/A	-
3	Black	Audio	No	N/A	-
* 4	Green	C. Video	Yes, to -->	7	Blue,RGB
5	Red	Red,RGB	No	N/A	-
6	Blue	Green,RGB	No	N/A	-
* 7	Not Soldered	Blue,RGB	see #4	see #4	see #4
* 8	Not Soldered	Comp.Sync	see #1	see #1	see #1

*Note: All wires remain unchanged, except the White, (Pin 1), and Green, (Pin 4), which are desoldered and relocated to the unused Pin 8, (White), and Pin 7, (Green), respectively. The plug should look as follows:

Pin#	Wire Colour	Function
1	Not Soldered	RF Mod.
2	Yellow	Ground
3	Black	Audio
* 4	Not Soldered	C. Video
5	Red	Red,RGB
6	Blue	Green,RGB
* 7	Green	Blue,RGB
* 8	White	Comp.Sunc

That takes care of the cable to the Geneve Video out plug, you should look to see if shield wire, (which is bare, without insulation), is soldered to metal case or ring which surrounds the plug, when re-assembled. You may now pull the plastic sleeve back in place.

As for the monitor plug, cut-off about 6 cm., (2 inches), of the wires and save for later use. Bare and strip the ends of the following wires and solder as indicated, (See ** footnotes before proceeding):

Wire color	Function	DB-9 Pin#
White	Composite Sync (C. Sync)	8
**Yellow	Ground	1
**Black	Audio RCA Centre	-
Green	Blue,RGB	5
Red	Red,RGB	3
Blue	Green,RGB	4

** PLEASE NOTE: Most analog RGB monitors have RCA audio inputs, similar to those used on tape decks and phonographs. Using a shielded phono patch cord, (a cable with male RCA plugs on either end), remove one end and bare the wires on the other. From the 6 cm., (2 inch), wires saved earlier, strip the ends of Yellow and Black pieces.

Solder one end of the short Yellow wire to Pin# 1 of the DB-9 Plug, as indicated above. The other end must be attached to Yellow wire on the video cable, plus the bared shield wire for the cable, plus the shield, (braided outer wire), of the RCA audio plug. Wrap this connection in electrical tape.

Solder the inner audio wire of the RCA cable to the bared-end of the Black wire. Tape this connection.

You may now enclose the DB-9 cable in the connector hood, with both the main video cable and the RCA audio cable exiting out the opening in the hood. If you have a multi-meter or continuity tester, you can double-check all connections for correct location and for shorts.

Pat yourself on the back for a job well-done and proceed to plug your new monitor to your Geneve. The following illustrations come from the 9640 SIG of Delphi:

EGA MODE

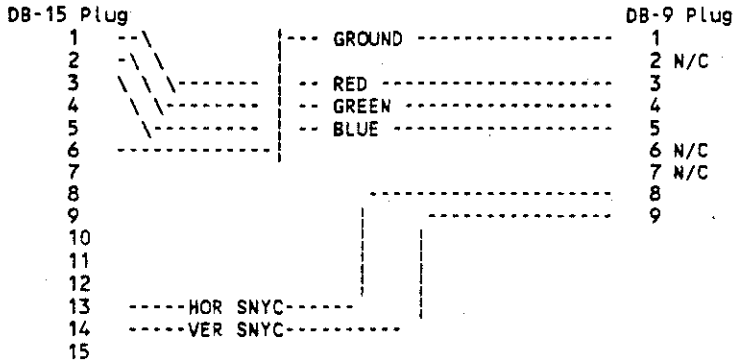

VGA MODE

TYPICAL VGA CARD PINOUT

TYPICAL MULTISYNC TYPE MONITOR PINS

Now that we have some facts, lets look at an example:

Working adapter cable.....

15 WIRES DOWN TO SIX !! OH WELL WE NEEDED A NEW TYPE DB-PLUG !

ALMOST FORGOT..... THE CONTROL BITS !

If you have a vga monitor forget the following,(even if you don't you can usually forget them): (Their purpose is to tell the card what kind of vga monitor you have, (color or b/w)

bit 0 pin 11 pin 11 grounded = color vga monitor
 bit 1 pin 12 pin 12 grounded = b/w vga monitor
 I found with the multimodes ... forget these pins.

I DO COMPUTER REPAIRS AND CONFIGURATIONS AS MY LIVING AND HAVE FOUND THIS SETUP TO WORK ALMOST ALWAYS !!
 Note: Please..... if you are not good at wiring or soldering, please have a valid technician do this for you.
 (CARDS AIN'T CHEAP..RIGHT !)

Now if your monitor is VGA multisync with a DB-15 connector, wire the corresponding DB-9 pinouts illustrated in the first part of the article to the corresponding to the corresponding DB-15 pins illustrated above.

Bit Pit Chas Andres

The following download came by-way-of Delphi:

May 8,1990 Tales of a Power Supply

Ever noticed your PEB gets really hot? Wished for a hard drive mounted in the PEB but know your PEB power supply can't handle it? Tired of your GENEVE LED winking out and your GENEVE and HFDC cards slowly turning brown around the power regulators?

I've been worried about it for quite some time... Tony Lewis advised me a while ago that the PEB power supply wasn't really designed for all of these new cards and drives which are being mounted in them. After losing a power supply (and sending \$50.00 to TI to get a new one) I decided that the way to go was to replace the power supply totally with a new "switching" supply.

TI designed the power supply around the technology of the time. The power supply is a "linear" supply. That means that your PEB has inside a huge power transformer, with simple regulating circuits that provide the power to the bus in the TI computer.

A switching supply avoids the huge transformer and heat problems by switching the power on and off very quickly (this has caused some interesting problems in offices that contain a large amount of PC based equipment). Switching supplies are very cheap due to their wide applicability to PC's.

One mistake (in terms that it has caused untold grief for board designers of the PEB) is that the TI linear power supply is underpowered and generates too high a voltage for the cards on the PEB bus.

This is what the TI PEB manual says the voltages going to the PEB bus should be out of the power supply:

BROWN	-	+16V
YELLOW	-	-16V
GREEN	-	+8V
BLACK	-	GROUND

Per the TI design, the cards that you plug into the PEB must drop these voltages to something they can tolerate with their circuits:

+16V	drops to	+12V
-16V	drops to	-12V
+8V	drops to	+5V

This isn't too bad, but the actual voltages I measured coming out of the TI supply were even higher than listed (I measure +20V instead of +16V, etc.). The drop in voltage means the cards must get rid of the excess energy somehow, and that means HEAT.

Also, the power going to the floppy drive(s) is inadequate for two full height drives, or even one 5 1/4" hard drive. I wanted to mount a 5 1/4" drive along side a 1/2 height floppy drive for a complete self-contained machine.

A New Supply =====

Browsing at the Trenton Computer Fair (in pouring rain) I found a Highlandbrand new power supply for \$50.00. Not a bargain, but I didn't want to trust this project to a used supply or one without a guarantee. The supply I picked up came mounted in a metal case ready to drop into an IBM AT compatible. Because it was mounted in a metal case, it came with a few extra goodies, like a new power connector for the back of the PEB and a low-voltage (and quieter) fan.

The supply I picked is a 200 watt supply, which I decided would have enough for my PEB with full complement of cards.

I started this project on a Sunday evening by opening up my PEB (I have a spare so I wasn't too worried about destroying this PEB) and removing the following from the left hand power section of the PEB:

- Power Transformer (remove four nuts)
- Terminal Strip (remove two nuts)
- Power Connector (unscrew two screws)
- Power Supply (remove two screws and unsolder wires to PEB bus)
- Fan (remove four nuts)

I kept all of the wiring to the front power switch and to the fuse (new model PEB's seem to have removed the

fuse on the rear of the PEB). I carefully cut two wires from the front power switch and soldered the 120VAC power connections to the power plug which goes to the new power supply.

Working on the new power supply, I unscrewed the low voltage fan and mounted it to the back of the PEB (after cleaning everything in the PEB, amazing how dirty it gets after six years) using the four nuts which held the previous fan. I unsoldered the 110/220 VAC switch on the power supply and soldered the wires together (to force 110vac) and taped the wires to prevent a short.

Deciding how to mount the new power supply took much of my time. I finally decided to use the plastic vertical mounting unit from the old TI PEB power supply, and drill a couple of holes and mount the new power supply board to it. The new power supply then mounted vertically in the same manner as the old power supply.

Fortunately, the new power supply came with several disk drive connectors (four to be exact). I removed one of the disk drive cables (cut it off).

The power supply also comes with connectors which are intended to plug into an IBM PC Compatible motherboard. I also cut these off and removed all of the wires except for the wires which had the voltages:

+12V
-12V
+5V
ground

I then soldered these wires to the bus in the same place as:

+12V went to BROWN
-12V went to YELLOW
+5V went to GREEN
GROUND went to BLACK

(Warning: If you decide to try this yourself, try and make sure that the cables going to the drive connectors are long enough to run behind the cards in the PEB. Mine were a bit short but were still usable).

Next came the hard drive. I just mounted a hard drive and a floppy drive side by side in the PEB and ran the cables out of the box before putting the whole thing back together.

Card Modifications

=====

Here is the nasty part of the power supply changeout, every card that you plug into the PEB will require a modification and the card with the modification cannot be plugged into a standard PEB without blowing out the card (time for a nice big caution sticker on the card).

The modification is quite simple, and is because the cards no longer need to do their own power regulation, the power on the bus (+12V, -12V, and +5V) is the right power that the cards need to run. The modification involves jumpering out all power regulators on the boards.

One way to do this is to remove all power regulators and then jumper across the contacts. I choose a simpler way which lets me remove the modification in the future if I so desire (remember also, at this point I wasn't quite sure this was all going to work!).

The power regulators have three prongs connected to a square body, and are usually located near the bottom of the card (usually one or two right next to the LED which sticks out the front):

The middle connection is ground, and should be left alone. I made up small jumpers for the outer two connections, and soldered all of them on the PC-side of the board.

Results:

=====

I modified the GENEVE card, held my breath, and turned on the power. Relief followed as the normal GENEVE Swan Screen appeared. I then modified my HFDC card and plugged in the hard drive. The system booted normally (so far so good). I then modified my TI Disk Controller (it was a bit hard to get the case apart) and plugged it into the floppy drive. The floppy checked out fine. The last card I modified was a MYARC RS232, everything OK.

I have several more cards to modify and try, including Ron Walters fabulous MEMEX 2-megabyte memory expansion card and a speech synthesizer card (somewhat useless in the GENEVE until the next MDOS release). (I'm going to check with Ron on the memory expansion card).

Summary:
=====

Was it worth the trouble? Total project time was three evenings of about six hours total. My PEB runs cool and quiet (and my cards are no longer turning brown). I have the peace of mind of a totally integrated computer within the PEB with a hard drive!

It was worth the trouble for me, and gave me a little respite from a long haul in programming.

Of course, I wouldn't try this yourself unless you have a pretty good knowledge of computer hardware and power supplies. In any case, you are on your own.

**RAVE 99 CO. PRODUCT
PRELIMINARY DATA**

**Professional Expansion Chassis
MODEL PE/2**

**It's time to get organized!!
You need to PE/2 it!!!**

Does your computer area look like this?

Yes, look right to see how it could be.

The development of the original TI-99/4A computer system was an evolutionary process with "NEED" causing new accessories to be developed and designed into the existing TI-99/4A computer as best possible.

The results gave us expansion modules connected to the side of the TI-99/4A as well as the "FIRE HOSE" and the P.E. Box. This type of system, due to its many connections, has inherent reliability problems as well as consuming large amounts of space on desks and tables.

It is for these reasons we developed our own Model PE/2 EXPANSION CHASSIS for the TI-99/4A.

As a result of the very favorable response to our new EXPANSION CHASSIS at the TI FAIRE in New Jersey, we have made the decision to build ten systems which shall be available in six to eight weeks. Any paid orders taken at this time shall be guaranteed not to be more than the estimated prices of \$275 for the GENEVE MODEL and \$325 for the TI-99/4A, even if the actual units cost more. Three of the ten units were purchased at the FAIRE in NJ. Call or write if you would like to reserve one!

Now, get organized with RAVE 99's NEW PROFESSIONAL EXPANSION CHASSIS for the TI-99/4A and GENEVE computers.

Our new EXPANSION CHASSIS has modern computer styling utilizing a space-saving design. The new chassis design allows the use of existing TI-99/4A or GENEVE computers, P.E. Box cards, and disk drives into a single enclosure.

A 200 Watt Power Supply provides more than enough power for the computer, P.E. Box cards, and FIVE Disk Drives.

Access to the cartridge port is available from the right side of the chassis.

The front panel has a Power Switch, KeyLock, Reset Switch, Turbo switch, "Power" LED, "Hard Disk" LED, and "Turbo" LED.

The Expansion Chassis has 8 expansion slots for TI type P.E. Box Cards.

This Product is required for those who wish to have both functionality and neat appearance around their computer work area.

The estimated cost of this system is \$275.00 for use with the GENEVE and \$325.00 for the TI-99/4A.

PLEASE REMEMBER THAT THESE COSTS ARE ESTIMATES!!

(Editor's Note: While this article addresses the specific problem of connecting two parallel devices, namely a HP Laser printer and a dot matrix type printer, to the same computer parallel port via a mechanical A/B style switch box; the same warnings would apply to using such a switch box for video, serial port, keyboards, etc. where either two devices are connected to a single port, be it video, serial or parallel. The same holds true if you have two computer systems "sharing" a printer, monitor, modem, etc. through a mechanical switch box. -Steve Mickelson, 9T9 U.G.)

MECHANICAL A-B SWITCH BOXES AND THE HP LASERJET

by Jim Baker and Emerald Jones
(UCLA PC Users Group)

Oops! Your Hewlett-Packard LaserJet breaks. If a specific set of chips has been fried (the input circuitry), you are stuck with a big repair bill. Hewlett-Packard will *not* honor awarranty if your Laser-Jet printer has been operated from an A-B mechanical switch box.

That's because the mechanical switch boxes have a habit of frying some circuits, and besides, the Hewlett-Packard documentation contains a caveat warning people to use only electronic switch boxes with these printers. Hewlett-Packard recommends you use an electronic switch box, which, because of its internal wiring, doesn't endanger Hewlett-Packard's input circuitry.

The threat to input circuitry on any peripheral exists when a mechanical box is used to switch between the peripherals. Hewlett-Packards are known to be sensitive to this condition. Comparable difficulties have been reported on Okidata printers and surely affect others.

Note that the equipment is at risk regardless of whether the connectors are serial or parallel, 25-pin or 36-pin, regardless of which type of mechanical switch box you are using.

Scenario: Two printers are attached to one computer through an A-B mechanical switch box. One is a Hewlett-Packard LaserJet, and the other is a conventional dot matrix. The operator works on the computer, using the switch box to change between one printer and the other. All equipment is turned on all the time.

When either printer is used, the signal (or logic) ground to the other is disconnected. In other words, when the dot matrix printer is being used, the signal ground between the LaserJet printer and the A-B box is interrupted. Since it has its own power source, the LaserJet's internal logic ground level settles to a slightly different level than when it is connected through the box.

When the box is switched to connect the LaserJet printer, if the power happens to go to the signal pin first, the LaserJet input chips and circuitry must absorb the energy required to equalize the levels. These chips cannot handle the transient energy and are stressed. The damage is cumulative and may eventually destroy the chips.

Whether the power goes to the signal pin first or the ground is a function of the switch box. Usually it is random. To determine if there is a power-switching hierarchy requires looking at the power switching with an oscilloscope. Not a realistic choice for many people.

Note that turning off the LaserJet printer when it's not being used, and not changing the A-B switch box position when it is plugged in will not necessarily isolate the printer from all surges. This is because EMI filters on the computer connected to the printer can bleed into the printer's input circuitry. It is possible for the computer ground to pass voltage from the computer (on) to the printer (off).

To eliminate the hazard, make both the signal ground and the shield (chassis) ground contiguous between the printer connectors to the computer connector within the switch box, regardless of which unit is operating.

1. Connect a wire in the box to make the signal ground circuitry contiguous from connector to connector within the switch box.
2. Also make sure that the shield ground (carried by the cables) is good from one printer through the box to the other printer. Tighten all screws connecting the cables and check continuity with an ohmmeter.

Another option: Use an electronic A-B switch box. For design reasons, the logic ground in these boxes remains intact regardless of which printer is on-line. The "newer cheap ones" are about \$100.

The following describes the pins to be wired, depending on the connector type. It involves soldering between the pins within the box. ***Do not attempt to do this unless you have some experience soldering electronic components.***

While it's fairly simple, it should not be attempted by the novice. For one thing, should you do it

incorrectly, you jeopardize some expensive equipment. While every effort has been made to clearly describe this procedure, if you attempt it and damage your equipment, the authors of this piece cannot be responsible.

Mechanical boxes come in two different types: those with 25-pin "DB" connectors (either parallel or serial) and those with 36-pin Centronics (parallel only) connectors. In effect a "Y" structure, the box has a connector for the computer and, in our A-B example, two connectors for the printers.

Solder a minimum length of insulated wire from any one of the pins on the computer connector to the corresponding pins on the printer connectors, i.e., pin 19 to pin 19. On the serial connector, all pins to pin 7. Then check your work with an ohmmeter. This will ensure that the signal ground is contiguous, regardless of which unit is connected.

Appropriate Pins: any one of the pins noted is appropriate to use with standard cables.

25-Pin Parallel wiring: Signal ground pins = 18 through 25; use only one of the eight pins available.

25-Pin Serial wiring: The signal ground pin (ANSI standard) is pin 7; the shield ground is pin 1.

36-Pin Centronics parallel wiring: Signal ground pins = 19 through 30; use only one of the 12 pins available.

NOTE: Once you've hardwired the grounds on the boxes that have 25 pins, you have, in effect, converted the box to either a parallel or serial box. Once it is so wired, you may not use a box converted to parallel with a serial hook-up and vice versa. Label the box clearly, so that no one can use it incorrectly.

(Jim Baker is proprietor of Computer Repair Center, Woodland Hills, CA, where he repairs computers and peripherals. Emerald Jones repairs writing from Newbury Park, CA.)

[Note: This article was downloaded from GENie and was taken from the September and October 1988 issues of the Pasadena IBM Users Group newsletter "Prompt>," but it was apparently copied from the UCLA PC Users Group newsletter.]

RAVE 99 CO. PRODUCT PRELIMINARY DATA

Professional Expansion Chassis MODEL PE/2

TWO VERSIONS AVAILABLE

The PE/2 Chassis is available in two versions. Model PE/2-A replaces the original TI-Expansion Box, while the Model PE/2-B provides additional space/modifications to allow the TI-99/4A motherboard to be removed from the TI-99/4A console and installed in the PE/2 Chassis.

MODEL PE/2-A

This version of the PE/2 allows use of the Geneve computer or the TI-99/4A console. When used with the GENEVE computer, only the keyboard and monitor are outside the PE/2, see figure A.

When used with the TI-99/4A console, the original TI-Flex cable is required to connect the TI-99/4A console to the PE/2 chassis, see figure B.

MODEL PE/2-B

This version of the PE/2 provides room for the TI-99/4A motherboard and RAVE 99 Keyboard interface card to be installed into the chassis leaving only the monitor and keyboard outside the chassis, see figure A.

The cartridge port is located on the right hand side towards the rear. Four drive bays are available, the fifth is used to mount the RAVE 99 Keyboard interface card. An internal "mini-Flex-cable" is supplied to connect the TI-99/4A computer to the expansion bus. Connections for the keyboard and video are located on the back of the chassis.

FIGURE A

FEATURES COMMON TO BOTH MODELS

- o Small size, 6.5"H X 16"L X 14.5"W, Saves table space.
- o Room for 3 accessible 5 1/4" Drives (single Height)
- o Room for 1 accessible 3 1/2" Drive (used to hold keyboard interface card in model PE/2-B)
- o Room for 1 hidden 3 1/2" hard drive
- o 200 Watt power supply with four disk drive power connectors. 110/220 Volt selectable. A/C power cord included. External power plug for monitor.
- o Eight Expansion slots
- o 3 LED Lights, Keylock, Reset Switch, and Power Switch located in front.

FEATURES UNIQUE TO MODEL PE/2-B

- o Room for the TI-99/4A motherboard
- o Access to cartridge port from righthand side.
- o Room for RAVE 99 Keyboard interface card.
- o Internal "Mini-Flex-Cable"/card.
- o Keyboard and Video connectors located on back of chassis.

FIGURE B

WHAT CAN CAUSE MODEMS TO STOP? OR HOW DID I KNOW I BLEW A FUSE?

-By Tom Jakabfy, OSHTI U.G.

It has taken me three weeks to unravel a web of events and get back to my normal operating system. It took me 3 hours tonight to get my latest problem sorted out. Here is the long and short of it.

It all began when a fellow OSHTI member, (Gary) club was having disk controller problems. This was not the clubs first time with a problem disk controller. About a year ago, my TI disk controller died in the middle of a TURBO COPY.

Anyway, my friend decided to get his controller fixed thru the TI office in RICHMOND HILL. After about 6 weeks he was sent a 'new' or 'fixed' controller card. When he went to use it of course it wouldn't work. He asked me if I would try it out for him and as usual I said OK.

The next night I tried it out. Of course the disk controller was without a protective clamshell case. Well, what happened was dreadfully scary. After I had slid it in my PEBox and turned it on, things seemed OK. When I tried to access drive 1 there was a puff of smoke and the reek of burning chips. I switched the power off as soon as I realized what was happening. There was a small bit of metal touching the side of the box since the protective clamshell was not there. Needless to say I was horrified.

The damage to the disk controller seemd centred around the power regulator that touched the side. My system on the other hand seemed to lose its memory (32K).

Fortunately I had a second 32K handy(a speech synthesizer type) and I was able to test some of the other parts of the box.

The RS232 PIO worked. The Horizon Ram Disk worked. So I went about my business as usual. Of course, it was difficult telling Gary about what had happened but he was most forgiving.

He has been able to repair some of the damage to the controller, but it still has problems.

Well about a week passed and I wanted to use my modem. I fired up TELCO and when I went to dial up a BBS nothing happened. What was the problem ?

Well I tested everything, the cable the modem my RS232. The modem did not seem to be responding to the RS232. By the way PIO did work and I could get print-outs as usual on my printer thru the RS232.

I went to a friends and tried out my modem. It worked on his RS232. I then tried out my RS232 in his machine. It worked. Aha...it was a problem in my PEBox !

After further discussions with my friends I decided to see if there was a blown fuse. Gary told me that the 32K and RS232 serial lines were on a 12 V power line and maybe a fuse was burned out.

It sounded too easy. It wasn't.

To get at the PEBox fuses requires one to remove about 12 screws from the PEBOX (the little ones). I had to remove the screws to the disk drive too. The PEBox slides forward so that you can get at the fuses...just barely. The first fuse I saw looked suspicious. I tested it. It was a gonner.

Down to RADSHACK to get some 3 Amp Slow Blow 250 V fuses. No problem. You get two for \$1.99.

Of course I brought two of my kids with me and among us we got three new batteries to boot. The manager didn't even bat an eye when I paid him with the only bill I had ...a fifty(just after pay day of course).

When I got home I put the fuse in, and reassembled the PEBox...screws galore. Everything worked just fine.

I decided to go for the newly 'fixed' 32K...my last mistake.

When I put the 32K back in, something didn't want to work. My ram disk forgot what was going on. More problems.

When I fired up the machine with the 32K from the synthesizer, drive one was accessed immediately by the system. No start-up screen.

When I turned on the ram disk from basic using CALL AD the system would lock up and play a bad sound. Turning off the RAM DISK lead back to the first problem...drive 1 was access (TI XBasic was in the cartridge slot). By the way, I could get to the menu via CALL MENU and check that all files were there.

What happened was this. There is a software switch in the ram disk accessed via CALL DN. My ram disk had the value changed so that I could not access it. I had to reconfigure my system to find this out. I did not lose my files, since I could back them up using a DM.

To be safe I went through the RAM disk chip check on MENU 7.3 just to be sure my system was cleaned out. Then I reconfigured the system and dumped all files back to the ram disk.

It worked.

I hope that my experience might help someone out there who has either blown a fuse or had a ram disk behave this way. Fortunately, it hasn't cost me too much. Well, I guess the 32K will eventually get fixed too.

P.S.

Further investigation did yield some problem files. Some had garbage on the end and had to be scratched. Fortunately, most of these files had back-ups.

The following is from Delphi...

Multi-tasking with the CLI By Beery W. Miller

Note: The following is information regarding the use of setting background tasks running while still having the MDOS Command line interpreter available. This code patching is written for V0.96H of MDOS. This code may not, and most likely will not work with other versions, but if you search in page >06 (using Diskassembler) for a MOV or MOVB instruction of some address into >0102 and modify that address accordingly, with the same type patch procedure listed below, you should not have any problems.

The CLI will 'occasionally' miss a character since the other tasks reads the character, but with a timing patch I used, 90% of the characters are caught by the primary task.

I have successfully had a 64K program running, run GPL, and return to MDOS to have my program still intact with no problems. It will even work running Adv. Basic and returning to MDOS, but be careful as when two tasks are running, attempting to type BYE in Adv. Basic to exit that task is extremely difficult. This routine can be used most likely for any background task without any loss of speed if no key presses are desired. Such as a running clock pgm, a pgm that detected a incoming call on a modem...., music, etc. It is only up to you.

Please make mention of my name and 9640 News in providing this code in any documentation that this feature is used in.

Other patches can be generated to provide an 'install' program that check what version you are running and uses the appropriate table for patching to resolve the addresses. It may even involve checking outside of page >06 if that page is reassigned in MDOS in the future.

Now enjoy, Beery Miller (9640NEWS on Delphi)

      BLWP @MDOS

```

* Notes on >0102 as the 'task' state used by the interrupt routine to determine the status of each task

- if the state is >00, the task is in run mode and can be swapped to another task by the interrupt routine.
- if the state is >FF (reserved for the CLI), the interrupt routine ignores the task if there are other tasks present.
- if the task is >FE, the task is locked and can not be multi-tasked
- if the task is >FD, the task is ignored and programs like the CLI in state >FF can still run (used to lock a tasks memory pages so they can't be freed, like the graphics drivers, or other code for a library)
- if the state is >01...>fc, the task is assumed to be asleep, waiting for the I/O or something and the interrupt routine ignores the CLI

What Paul says about >0102 is it is a counter that is decremented by the interrupt routine that runs every 1/60 second. When it reaches >0000, another task is mapped in and runs until it is is decremented. The interrupt routine first determines the state of those tasks. That is why I mapped >0000 into the CLI to make it an even run time task. When I move >0001 into my task (can't go smaller), it is decremented to zero and only stays in the task about 1/16 the time it would have normally been there. Note this is only good for v0.96H (I haven't checked V1.14F to see if those bytes are in the same location. If you use DISKASSEMBLER and disassemble pages >06 and find where it moves bytes into location >0102, you can check for other versions if those bytes assembled out of position.

I hope this helps. If you have any questions, feel free to ask. DISKASSEMBLER is an invaluable aid to learning more on this system. There is a lot more that can be learned by diskassembling the CLI than most other programs source code. Check with TOMSFREE on Delphi (Tom Freeman) for ordering info you haven't purchased it yet. That is how most of my work so far has been done. Catch you later.

-eery

Feedback

It's all coming

First of all I want to make it clear that this is not an ad for a given piece of equipment or a particular piece of software, although what I am about to say must invariably name items to reinforce my point. I can't help that, because there just isn't enough competition to generalize what these items do.

Recently, I acquired two programs in as many days, the new GIF loader from Barry Boone and a fairware version from Germany by Achim Liese. No, let me drop back just a little further and say that six months ago I bought one of the last of the old Mechatronics cards from Aagard that remained available in this country. At the time, the purchase distressed me slightly because I had problems getting the 80-column card to work. That turned out to be a cabling problem with the Magnavox 515 monitor, and, also, I had not yet mounted the new EPROM from Barry Boone in the card. I also found that the software (TI-Writer and Multiplan) that came with the card was a mess and hardly worked at all.

To make a long story short, I finally got everything working (hardware wise), which was quite simple once I had everything I needed. During that time the Funnelweb system came through in 80-column mode giving me a magnificent and reliable 80-column word processor. This in itself opened up a whole new world to me, allowing me the privileges of not windowing my text all the time.

Mind you, I am a writer. I cannot get 280 pages of text into my TI, so I am forced to use a Tandy 1000A to write a whole book. This doesn't please me one little bit. I swear to all that are reading this, that is the only thing I use the Tandy for. I still write all my MICROpendium articles on the TI, and anything else that will fit into the memory. I love graphics, as many of you are aware. I have never found anything that beats our machine for graphics. The number of fonts (250+), the formats available, the ease of dumping it to the printer — all these are lacking in the IBM world. The writer clones we have are as versatile as anything I use, and, in most cases, more so than any word processor for the IBM. I still convert the Tandy text files to TI via

have to do is wait a little longer. It's all coming! I will guarantee you that.

Harry T. Brashers

MICROdex

FOR TI BASE

Your Window to Information

MICROdex is a fast, easy to use, publication indexing system that places an enormous amount of information at your fingertips. Frantically searching through all your magazines for particular article, program, or review, is a thing of the past. MICROdex can even help you better understand the powers of TI Base.

With MICROdex, you can locate the source of various information printed about the TI-99/4a, and in some cases, the Geneve 9640. Any article, program, review, or editorial, that has appeared in many TI-related publications can be quickly located by subject, source, or type. Printed reports can also be prepared based on different search criteria, including a comprehensive listing of all references. On-line help is even available.

Written in TI Base for TI Base

Although MICROdex is a complete database application, it can also be used to show how TI Base applications operate. The entire MICROdex indexing system was developed using TI Base, and its data files are stored in the standard TI Base format. The command (program) files included can be viewed using the TI Base editor, and altered to suit your own needs.

MICROpendium MICROdex Released! First TI BASE Application

Thousands of References

Due to its large size, MICROdex is divided into two volumes. Several thousand references about the TI-99/4a and Geneve 9640 are recorded, categorized, and stored in those volumes. TI Base (sold separately) is required to use either MICROdex volume.

MICROdex Volume I
MICROdex I, a four disk set,
indexes information from the
following publications:

- MICROpendium
- Computer Magazine
- 99er Magazine
- Home Computer Magazine

Only \$14.95

Special Combination Package!
Order both MICROdex
Volumes I and II for
only \$22.95!

MICROdex Volume II
MICROdex II, a three disk set,
indexes information from the
following publications:

- Byte Magazine
- Computer Shopper
- Creative Computing
- Enthusiast 99
- Family Computing
- Mini Mag 99
- Popular Computing
- R/D Tech Newsletter
- Super 99 Monthly
- The Smart Programmer

TEXAMENTS

Office: (516)345-2134 244 Mill Road, Yaphank, NY 11980 BBS:(516)475-6463

Please add the following shipping charges to your order: \$2.50 for domestic first class delivery, \$4.00 for foreign insured air mail delivery. Orders are usually shipped with a 48 hour period A/C/D orders must be placed by phone. No credit card orders will be accepted. Product specifications and availability are subject to change without notice. Dealer and User Group inquiries are invited. Contact our office for more details and special offers.

ONE GOOD REASON TO ORDER SUPPLEMENT #3

THE ARTIST SAMPLER

ONE OF THE BIG PROBLEMS IN OWNING A GRAPHICS LIBRARY IS THAT YOU HAVE NO GOOD WAY OF REFERRING TO THE PICTURES TO FIND WHAT YOU WANT. IN THE PAST, THE ONLY WAY WAS TO FRINT THEM OUT WITH ABOUT THREE TO THE PAGE AND STORE THEM. IF YOU HAVE A BIG LIBRARY, THEN YOU HAVE A LOT OF BIG NOTEBOOKS, BIG PAPER BILLS, AND BIG PRINTER RIBBON BILLS. NO MORE!!

AS YOU CAN SEE IN THE ILLUSTRATION ABOVE THE ARTIST SAMPLER WILL FRINT OUT 20 PICTURES PER PAGE, FROM A DISK, AUTOMATICALLY. IF YOU LIKE A LITTLE HIGHER RES THEN YOU MAY ALSO GO WITH THE 6 PER PAGE OPTION. IT FRINTS THE FILE NAME OF THE PICTURE AND THE DISK NAME ON THE TOP LINE, SO REFERENCING IS COMPLETE.

THE PROGRAM IS BY BOB COFFEY. THE AUTHOR OF THE MAIN ARTIST PICTURE PRINTER THAT WAS INCLUDED WITH THE MAIN HOME PUBLISHING MANUAL. THERE WILL ALSO BE AN UPDATE OF THE PICTURE PRINTER ALONG WITH THE SAMPLER, AND SOME OTHER NEAT GRAPHIC UTILITIES AS WELL.

YOU CAN'T AFFORD TO PASS UP SUPPLEMENT #3 OF HOME PUBLISHING ON THE 99/4A. ONLY \$10.50 INCLUDING THE POSTAGE.

HARRY BRASHEAR, 2753 MAIN ST. NEWFANE NY 14108
