THE FEST THAT WAS

6

Caring and sharing were the most obvious by-products of Fest-Mest. He very much follow the Avis slogan "ME are number 2, so we try harder." It is not a contest of the most attendees, or the most vendors. It is just being there. The success is the effort of many. Mone of us can be all things unto all people. Setting aside ego and being open to anything does away with tunnel vision. He strive to improve by admitting imperfection. B.J. Mathis of Tucson found a need and not only willingly stepped in to handle it, but already has expressed her availability to S.M.U.G. (Las Vegas) for Fest-Mest 88 registration. Our personal thanks B.J. for bailing us out.

NO.

6

There is a song around now "I've got a new attitude." That is something we all can consider. The months preceding the Fest. Gail Fair (aostly) and Terrie visited other User Groups encouraging participation. There is a vast difference in attitudes and emphasis agong these groups. We can all learn from both the negative and positive aspects observed. Case in point, the groups that have more hands on participation by their members during meetings are the ones with the least difficulty in getting group cooperation in events such as the Fest. We observed this in Boston with the excellent group participation of the Nutmeg group, small but very active. Here we saw similar enthusiasm and cooperation among the Brea group. Gail has been very impressed with the quality of their meetings and we will take their lead. Demo only acetings can indeed lead to inertia. We in the last year or so have attempted to invigorate our meetings, and have clearly done so but see yet more room for improvement. The fruits of Brea's labor were in the number of new members signed up at the Fest. Their booth was fun and an asset to the Fest. Thanks.

The announcement that 99'FEST-WEST'87 would be held in Las Vegas has certainly brought about some real positive communications. Cheryl (Regena) Whitelaw is just bubbling over with enthusiasm and willingness to participate in a hands on manner. Great news for SNUG. I just called John Martin and passed along this happy information. Thanks Cheryl. The date for Las Vegas is still up in the air, they are attempting to get the schedules of other fests to avoid a conflict.

Over the next few months we will be printing ads from the various participants in the Fest. Their products are all worthwhile and bear your consideration. Many will also be available through our MARKETPLACE at discounted prices.

Just a little dry information on the Fest mitty-gritty, only because ais-infoaation is circulating. Other area Fest holders can attest to hidden costs, rental, insurance, electricity, decorating (booths, tables, chairs). It all adds up. We sub-let the Shrine Mezzanine in conjunction with an ongoing sain level computer event. We are not bothered with the detail work, only meeting the cost of the sub-lease. The cost was a 30% increase over last year and was very obvious we could not carry it alone. Tom Irwin a former LA 99er and now President of the SCAN Amiga group was approached by me to split the mezzanine and the lease cost. This was successfully accomplished. It was necessary to increase the booth rental over last year to avoid going too far out of our treasury. \$100 for two days is commensurate with \$50 for one day charged by other areas. We do not get the gate cost, the promoter gets that, deservedly. There is a definite advantage to the generic computer related values on the main floor.

A couple of User Groups sent a donation to fund the Fest, the balance was from the LA 99er treasury. The telephone line installed for the GEnie international conference, the hospitality room, beverages and snacks, the Fairware booth and eailings, the 1599 Postcard notification are some big ticket items we sponsored. Early incomplete estimates show a potential

non-recompensated cost to the club of \$500.09. We feel it was all worthwhile.

#### **DUYER DEMARE ALERT**

We have recently had two communications from international members about their experience with Pilgrim's Pride. Apparently they sent funds for merchandise and have still not received anything. Furthermore, their letters to the company have gone unanswered, although their checks were cashed. Until this matter is cleared up, we would suggest not dealing with this company.

June 24th meeting, we will have a great double bill, our can Doug Moore on FRACTALS. (if you don't know what they are be ready for a big surprise). BAT our new correspondent, Barry Traver will show us what we missed in LA by his being at the excellent Ottawa Fest.

BE THERE!!!

#### THE BEST THAT WAS

Our User Group exchange list is close to 149, in and out. He read every one of them. There are some gens there, and then there is a disturbing trend also. We have always been candid, by volume of comments more often appreciated than not. To the san we react not act. There has usually been provocation, scans and unproductive action. We receive as well as give, usually tell it as we see it and Caveat Emptor. Recently there has been an outpouring of unfounded vence and judgmental criticise unfairly spewed. I (Terrie) do the best I can do at any given moment. Those that know me well know it is within the framework of a very severe non-functional depression. I apologized some time ago by mail to an individual for my "procrastination", the reply was "I had no right to procrastinate"! Hell with that as an example of standards set up for me by another, I will continue this discussion of "best".

The best that Richard Mitchell can do with his fine Smart Programmer is not good enough for those who demand it be exactly on time, and accuse him of cheating them ala HCN. Richard is a full time employee with an excessive amount of expected overtime, he is a husband and parent with at least the same amount of domestic stress lots of us have to deal with. All this in addition to singlehandedly compiling a fine publication. Why is this not recognized as the best he can do at this time.

Barry Traver, his sharing of himself on both Compuserve and GEnie give him an extra dose to be aware of his best not being enough. It indeed does pain him that the remarkable Genial Traveler is not as timely as he had hoped. Just in the last month he felt compelled to spend an incredible amount of postage money to let us know an issue was imminent, just to follow it up with an errata notice. Anyone with paper and pencil can calculate the cost of 9 disks, 6 mailers, two postcards per subscriber and come in way over \$30.00 subscription fee. In addition to the two data networks, Genial Traveler, Genial Computerware, Barry home-schools John Calvin and Preaches. Where is his best not enough?

Craig Miller, his best was a red flag challenge to a certain mentality to break and circulate. These then have their defenders at nauseum, those who publically stand up for Craig are called irrational Miller worshippers. Really! Now a certain few are using words like "cheat" "steal" "deserter" "traitor". Based on what? Not facts that is for sure. Turbo-XT was Tritons idea, not vice versa. It was geared to the console and tv set, (by far the majority). Deserter? just who do you think designed the new fantastic Super Extended Basic module.

Step down off the vituperative soap box and recognize the destructiveness of this parochial pontificating. Recognize the unsung productive persons within your group, be they young or old, sophisticated or down home, encourage and expose them. Is your glass house without streaks? We can all learn from one another. I can't (or haven't) program, but I sure can appreciate Tom, George, Craig, Doug, Mike, Peter, Barry, Richard, Chris, etc. I am enriched by them, they produce action not drivel.

No one above has asked me to publicize their linen, me neither. It is just the other side to the rank criticism rampant now. Blow the whistle on deservers, but for goodness sake get your facts straight and be honest, stash the ego.

Additional note from Tot: I ame in completel aggreement with Terrie's sentiments expressed above. I just would like to add, with regard to my "open letter" a couple of months back, that I continue to maintain the policy of not criticizing anyone who has not gratuitously "bashed" someone else first. I defend my friends and those I respect. Not because of "hero-worship." of which I have been accused, but rather because I do not choose to associate with those whose own ego gratification seems to depend on nastiness towards others. Enough said — I tend to get rather emotional about the subject, as you all know!

### BAT'S "IN THE BELFRY"

"Twinkle, twinkle, little bat!
How I wonder what you're at!
Up above the world you fly,
Like a tea-tray in the sky."

Perhaps you recognize those words by the Rev. Charles Lutwidge Dodgson, mathematics don, clergyman, and literarian. Since I share those (a)vocations, perhaps those words may also serve as an introduction to this column, "In the Belfry," written by Barry A. Traver a.k.a. "BAT" (watch that "tea - tray-ver is the correct pronunciation, long ay, no ess).

This column will have no consistent theme from issue to issue, so you will indeed be able to wonder what I'm at! (In fact, we may make this place a real wonderland, which is a world within itself, for all is in wonderland, so to speak.) But enough of introductions. In this issue I'd like to mention (promote?) two items that should be of interest to many: (I) a "sort experiment" by J. Peter Hoddie and (2) a source/code tutorial by Mayne Stith. The first is fairware, the latter is public domain, but we are I believe much in debt to both authors.

(1) J. Peter Hoddie's SORT/EXP is an assembly language sort program that will in essence sort any type of file of any record size (DV20, IF20, or what have you) on up to 8 different user defined fields. It can handle either 1200 records or 24K of data (whichever comes first) and sort in either ascending or descending order, using either a shell sort or shuttle sort (your choice). It is very fast, perhaps twice as fast as the famed Clulow/Romer sort (which, however, was limited to DV80 files).

The program is very easy to run. You supply the name of the disk file you want to sort, and then indicate the starting character position and length of field of each field you want sorted. (Most people will not need to sort on eight fields, so you can just tap (enter) when you've provided information for the fields you do want to use.) After you tell the program whether you want ascending or descending order and which type of sort to use, the only thing remaining is to supply the name of the disk file to which you want the sorted data to be written.

There's one bit of information not included in the present documentation which you should know: If you make a mistake in typing a file name, you can correct your entry by using CTRL-H (FCTN-S will not work). The program was originally written on a Myarc 9640 (the "Geneve"), and CTRL-H and backspace are equivalent on the Seneye keyboard (and on most computers, for that matter).

The first release of this program - sent cut on the first volume of the John Calvin fairware/public domain project - contained a minor error in the source code. (Unless you entered other than a single-digit number for starting character, you would never notice anything wrong.) Here's what to check in the source code for the file ECRT/EXP/S. Lines 720-722 should read as follows:

9723 SRL R3.8 make it a word 9721 MOV R2.R1 Thank you, Toa Freeman!!! \$722 MPY @DIG.R1 multiply current value times 16

If you have a copy of SORT/EXP/S that does not read like this, just insert the MOV R2,Ri before the MPY command, and you'll be all set.

Here's how to make the program image SORT/EXP file, it it hasn't already been done for you. Fut the source code on a disk in drive one. (Yes. Virginia, Peter does give you all the source code!) Assemble SORT/EXP/S to create a file that you can call SORT/O. Then assemble SAVE/S (also supplied by Peter) to to create a file that you can call SAVE/O. Then - using option 3 of the Editor/Assembler - load in DSK1.SORT/O, load in DSK1.SAVE/O, and link to program name SAVE. You have just created DSK1.SORT/EXP, a program image (Editor/Assembler option 5) version of the sort utility!

How do you obtain a copy of this exceptionally useful program? Individuals can freely copy it and pass it around. User groups or commercial organizations must first obtain written permission from the author for permission to distribute, but you can download it from Computerve or bine (if you have a modem) or order it for \$3.28 from John Calvin Traver, 835 Green Valley Drive, Philadelphia, PA 19128 (cost includes disk, copying, cailer, and first class postage). If you like the program, you can send \$19.00 to J. Peter Hoodie, 12 Paul Revere Road, Lexington, MA 82173.

(2) Wayne Stith's public domain program NWIKFONT appeared in the Genial TRAVelER #6. The program is a character pattern editor, by which one can alter character patterns and store them on disk for later access and use by a BASIC program. The program is self-contained, requiring no external documentation, and - as you might expect, since it's all in assembly - is very fast. (Genial TRAVelER also contained a utility to create a CHARA1 file from a character set created from KWIKHUNI.) What many people don't know is that (a) the full source code can be ordered directly from Wayne at a nominal price (\$6.00) and (b) the source code is actually - in my opinion - one of the best tutorials currently available for learning assembly language.

The tutorial takes up both sides of a flippy, and prints out to about seventy pages or so. You'll find things clearly explained here that you won't see explained clearly (or often at all) in Lottrup, McComic. Molesworth, or Morley. If you're a novice in assembly language, you'll find a lot of help in this material. (I have to admit that Wayne helped me get a handle on a number of things I wasn't sure about myself!) If you want a copy, just send your \$6.03 to Wayne Stith, 715 Timken Drive, Richmond, VA 23229. I don't think you'll regret it. (Wayne calls it "an idiot's guide to assembly language," but that's exactly what some of us have been looking for!)

Well, that's enough for this month's column. And if you guessed that the Reverend C. L. Dodgson used Lewis Carroll as a pen-name and is the author of <u>Alice in Wonderland</u>, from which the opening quote came - you are to be congratulated. ("I wonder what he's going to come up with for the next issue....")

### FROM THE DISK OF....

#### by Mike Dodd

Yes, I did write a column last month. What, you didn't see it?? Gee. Now that I think of it, neither did I! We have the wonderful (?) US Postal Service to thank for that. I mailed it out May 8 "Next Day Express Mail," and Terrie got it the 11th. Very impressive. Oh well. This column, therefore, is last month's column with some of this month's thrown in places. Terrie has threatened me with a horrible punishment if I don't write something, so you can send hate mail to her for making you read this.

The Dots Perfect, which I received as a gift from Terrie, Tom, and George, is a wonderful device. I've got one for my yuccky old TI MX90 printer, and the print quality has improved dramatically. It gives my printer, in addition to what it already had, optional slashed #'s, italics, super/sub script, and NLG (Near Letter Quality) mode. PLUS, it lets me pick the font settings I want from the printer, instead of having to send a control code to it. For NLQ, I hit FF with the printer on-line. For draft, it uses LF. To activate the menu, I press the On Line and FF keys together. Now I go through the menu by pressing the FF key, and toggle the choice on or off with the LF key. When I'm done, I press On Line, and the printer is ready to print. The senu choices are: Enlarged, Esphasized, Double Strike, Condensed, Perferation Skip, 1/2" left margin, Italics, Underline, Fine Print, 8 Lines Per Inch, and Slash 9. Fine print is a combination of Condensed, Superscript, and 6/72" line spacing (12 LPI). That is TIMY print, but VERY legible.

All in all, I'm very happy with Dots Perfect. If you have an older model printer, this is definitely for you. Note that it comes in models for many different types of printers. I have only one complaint with Dots Perfect: it doesn't include Elite mode, which I had on the TI printer with the Epson EPROMs installed (no, it wasn't documented, but it was there). I'm surprised that Elite isn't included in this. But still, it's worth it, and don't let the loss of Elite stop you (I'm not sure if all the models of Dots Perfect lack Elite - the versions for other printers may have it).

Here is a fix to one of TI-Writer's "features" (aka "burd").

Using a sector editor program (i.e. Advanced Diagnostics), edit sector 30 (31 if counting from one) of the FORMA1 file (or the FORMAT file with My Word). At byte 38 (hex >3A), change the >A067 to >A002. This will stop the formatter from automatically putting two spaces after a period.

There are other changes I have made to the Formatter as well. I have changed the @ and & (bold and underline) to ' and \ (FCTN C and FCTN I), and I changed the "#" (for mail merge) to a "!" (FCTN A). The reason I changed the last is that, in a document, if you have an asterisk followed by two or more numbers, such as #11, or #256, the formatter will drop the # and the two digits immediately after it. That's what happened a few places in Tom Freeman's catalog program. Anyway, the changes are all in the first sector of the FORMA1 file. For the @ and & fix, change the @ and & at byte 115 (hex >73) to ' (FCTN C) and \ (FCTN Z), or whatever you want them to

be. To change the "#" to ":", change the # at byte 112 (hex >70) to : (FCTN A), or anything else. Rick Cosmano of the SCCS is to be credited for the 0 and 1 fix, the other two are mine.

By the way, the change for 0 % \* is totally useless on the Geneve's MY-Word processor, since the formatter for it includes commands to change them.

Terrie Masters' big problem is that she is too modest to acknowledge the fact that several people think she is an incredible person. Since we obviously can't let that happen, I'm taking it upon myself to remedy the situation. After the Fayuh in Boston (April 4), a lot of us went to a ballroom at a nearby hotel to talk. There, the Ottawa Users' Group, which had 16 members there, presented an award to Terrie for her outstanding support of the TI community. Congratulations, Terrie! You deserve it. (The award was what Terrie was referring to in her column when she said "Thank you Ottawa, what a surprise.")

By the way, at the May 16 Ottawa Fest, Barry Traver was given a similar award for his support of the TI community. Congratulations to both of you!

A few people have asked how to detect the differences between different versions of XB and different peripheral cards when writing a program. The method I used in XBasher to detect MYARC XB II or II XB (or one of its offshoots, i.e. Mechatronic, GK XB, etc)

18 CALL VERSION(X)

28 IF X=128 THEN RUN "Triton Super Extended BASIC version"

30 IF X>=300 THEN RUN "Geneve 9640 Advanced BASIC version"

46 IF X>=266 THEN RUN "MYARC Extended BASIC II version"

50 RUN "TI / 6K Utility I / Mechatronics Extended BASIC version"

To detect between a CorComp and TI disk controller card, the method I used in my modification of REDISKIT was:

19 ON ERROR 49

25 DELETE "LD-CMDS"

30 RUN "CorComp version" 46 RUN "TI version"

I don't know an easy method (or even a hard sethod) to detect the MYARC controller. Does anyone out there have any bright ideas?

Last conth, George Steffen wrote an article on eliminating memory waste from assembly programs. Over the years, I have come across a few tricks for XB, as well.

One programming method I frequently see is:
18 PRINT "HELLO" :: PRINT "HOW ARE YOU" :: PRINT "I
AM FINE"

That can be drastically shortened to: 16 PRINT "HELLO": "HOW ARE YOU": "I AM FINE"

That does the same thing, only quicker and uses fewer bytes.

Another programming pitfall is the line:

4>5

GE

28 IF X=A THEN 38 ELSE 18

36 .....

Line 29 can be redone to:

29 IF X<>A THEN 19

Again, it runs quicker and takes less sesory. Here are the opposites of several relational operators:

is the apposite of ⟨⟩

< is the opposite of >=

> is the opposite of <=</p>

So, if the relational clause in line 25 was <=, then you could change it to > and eliminate the ELSE.

Here's one example of where XB can save many bytes. Take the following:

1# A=2 :: B=2 :: C=2 :: D=2

This can be changed to:

19 A,B,C,D=2

The same goes for string variables. At="" :: Bt=""

can be changed to A\$,B\$="".

Another thing I've noticed (and one that I've been guilty of, too) is the practice of putting, at the start of a program, a command to set numeric variables to 9 and string variables to "". When XB starts to RUN a program, it automatically sets ALL numeric variables to 9 and string variables to "" (null string), so there's no need for you to do that. The only exception to that rule is if you use the RLN "filename", CONTINUE command of HYARC XBII or Advanced BASIC, in which case the variables are not changed.

Finally, here's a very small way to save bytes (or byte, in this case). Take the following:

10 CALL KEY(0,K,S)

29 IF S(>1 THEN 19

As you'll recall, the Status from a CALL KEY will be set to either -1, \$, or 1. So, if S is not set to 1, S will be less than i. Therefore, line 29 could be changed tòs

28 IF SK1 THEN 19

There are more ways than what I've put here to save bytes in XB, these are just the ones I can think of off the top of my head.

For the "Nike Dodd almost-useless program of the sonth". I present to you an assembly program designed to act as a stationary TRACE command. It displays the line number at the bottom of the screen, without scrolling. I used this when writing XBasher to detect which lines were taking the longest to execute. Credit must be given to J. Peter Hoddie for giving se the idea for this, and for providing assistance with one of the bugs. Thanks Peter!

After I wrote my TRACE routine, I decided, in a fit of madness, to fully explain and comment the program. So that others might learn something from it. I hope that my comments actually help you, rather than confuse you.

To use TRACE, type it in with the Editor/Assembler. Assemble it with the object file mased TRACE/D and with the R option.

To use the program, go into Extended Basic and type CALL INIT :: CALL LOAD ("DSKn. TRACE/O") (ENTER). Now load your XB program. To turn on the trace, type CALL LINK ("TON"). To turn the trace off, type CALL LINK("TOFF"). You may also use these commands from within your XB program. If you have the trace turned on when you type RCN, you will see the line numbers in the program quickly scan by on the screen before the program actually starts to do anything. These are the line numbers that XB is pre-scanning.

The comments in the source code give directions for

```
changing the row and column for the position of the
trace.
```

Ιf you have any questions, write or call se (sy address is in the source code).

```

### XBASHER, A Review

by Scott Darling, (C)opyright 1987

Written by Mike Dodd, Distributed by Genial Computerware, Box 183, Grafton, Ma. #1519, #19.99, All A+'s.

This program is needed by anyone and everyone!! No clarification you say?? EVERYCHE has an Extended Basic program! AT LEAST one!! This program will make that one program run faster and reduce its size. GUARANTEED!! Host of us who have been around the Ti World for awhile remember what SMASH is. The BAD part about SMASH is you had to start it at night and HCPE it was done by adming!! You won't have to worry about XBASHER! Xbasher runs out of the Extended Basic environment. There are two versions available. One for TI XB and one for Myarc XB II. No mention was made of the 9646 compatibility. Probably because the 9646 will be so such faster. You can even run XBASHER on combined XB and A/L programs. Complete instructions are given on how to do this!

To run XBAGHER requires that you save your Program in Murge format using the following: "OLD DSKn.filename" then "SAVE DGKn.mergename,NERGE"." Then insert the XBMGHER disk in drive and select XB. The disk files will determine which XB you are using and load the correct version of XBMGHER. After the program has loaded, you are presented with a title screen. Next is the option screen. Which is: Shorten Variables, Crunch Lines, Remove REMS and !'s, Remove Let's, Change CALL CLEAR to DISPLAY ERASE ALL (this one alone saves you 5 Bytes!), Don't Change CALL SLB routine Digits, and Change Constants. Some of these are obvious as to what is going on.

Shorten Variables will take all your String and Monstring Variables and shorten them to one then two character variables. There is an immunes saving in memory by doing this. Tho, most people like to have a 'name' for variables. If the variable name is less than 3 characters it is no saving in memory. Its when you go giver this limit that memory is being eaten away. There is also an option to print the Variable list to an output device.

Next is crunch lines. This was VERY impressive. XBASHER will crunch or combine lines together. So what about the lines that are 6070'ed you ask?? (Well somebody will ask!!) The A/L in XBASHER keeps track of the logic flow of the program! THIS part makes the program FAR superior to SMASH!! The only bad thing about this function is that the line length of a line number is so long you say not be able to edit the new line!! Considering this is the only drawback, it is a worthwhile option! I have been able to get 8 lines of code to a line number....so did XBASHER, Mext is REMOVE REM's and !'s. Remarks are good for developing a program but are a hindrance when actually running the program. This option will delete them and restructure the resulting deletion of them. Remove LET's. PLEASE I hope everyone by now realizes the LET statement is inconsequential to programming!

Change CALL CLEAR to DISPLAY ERASE ALL. Nothing irls me more in XB programs than to see a "345 CALL CLEAR" then "356 DISPLAY AT(12,1):...". If you use "356 DISPLAY AT(12,1)ERASE ALL:" it does the same thing as CALL CLEAR and saves emercy!!

Next is Don't change Sub Digits. What this option does is change the numeric constants to the characters @,\,[,],and\_. This saves 2 bytes per each occurance of the variable. But, because of the nature of CALL SLB routines this may cost you MORE memory than any savings. Also, note. CALL SUB routines are like a separate XB program within a program. Consequently you can use identical variable masses in CALL SUB's as in the program without any type of error received by the Basic Interpetor, Also, CALL SUBS are slower processing than GOSUB's. The only advantage is to CALL SUB's is variable variable passing!! (Are we confused yet??) Lastly is the Change Constants option. Basicaly what was said in the previuos paragraph applys to this option. EXCEPT in this environment, this option will save you seemry. Don't ask me why there is a difference. Just believe me!! So such for the option list. Each option has a letter reference. By pressing that Letter toggles each option on and off. Hitting X says you like what you see on the Screen.

Mext screen asks for the input file name. The one you saved in MERGE format and checks to see if you remembered the filename correctly. Then asks for an output name. And even provides a suggested name. Naxt is an output device and name for the variable listing if you selected that option. FINALLY the computer starts doing the work!! The screen will show you the status of the program. A line count, the last line number referenced by a goto, gosub staement will be shown on the screen. Xhasher makes two passes thru a program. First to make lists of variables, line numbers and other info. The second pass will write the new program to disk. How long will it take?? The size of the program involved is the ONLY factor. I ran an 11 sector file thru XBasher and it took 5 minutes to do the job. The savings were 500 bytes. Next I ran the ultimate EGO test on XBASHER. I wrote a BBS program that is 90 plus sectors long. Almost 23K in bytes. So, I ran XBASHER against it. I felt I was a decent XB programmer and there was no way XBRSHER was going to save any bytes in MY program!!

Nell after about 30 minutes and my selecting ALL the options. The darn program found 200 bytes somewhere!! I'm still trying to see where it found them!!

To sum it up, Xbasher is the perfect compliment to any XB program. You only need to run it once, and save the resulting code. XBASHER will show you what XB programming is all about! There is a lot of power in that cartridge!!

### XB:BUG, A Review

#### by Scott Darling, (C) opyright 1987

XB:BUG is written by J. Peter Hoddie and Distributed by Genial Computerware YB:BUG is an unusual program. It is like DEBUG for the Editor Assembler. It can be resident in memory and called upon at any time. It allows you to follow a program as it progresses through what YOU programmed. As an experienced XB programmer, I can't tell you how many Hours I spent MARUALLY tracing, deciphering, and endless mapping of a program to see where I went wrong!! We know have such a program to take all the FUN(?) out of the old methods. XB:BUG requires XB version 110 and above, Disk, and JZK. Printer is optional the almost essential. I also ran XB:BUG on the new Triton Superxb with no problems. XB:BUG will NOT work with Myarc XB II. as the memory locations are totally different.

The only limitation to XB:BUG is not the program but the memory limitations of XB. The program is 5K long. If you attempt to use XB:BUG on hybrid XB/AL files. You will have to remember that XB:BUG loads in Low Memory. There is a >A000 version on the distribution disk. You will be limited to and 18K program in the >A000 space. Like I mentioned, this is not a limitation of XB:BUG, but the 4A's.

To load XB:BUG, use the standard "RUN DSK1.LOAD" format or auto boot from power up. Normally you would load XB:BUG first, If, for some reason, you want to load XB:BUG after your code, there is a version on the distribution disk. After XB:BUG is loaded the READY prompt will return on the screen. Now you can load your XB program in the normal method. To activate XB:BUG you press the Control and Shift keys simultaneously, or you can do a CALL LINK("GOBUG"). Then you will be presented with the main debugger prompt. The following commands are available. Array: This allows you to inspect the contents of an string or non string array.

Breakpoints: Setting breakpoints allows you to stop the execution of the program at various points to check for the other functions of XB:BUG. It is NOT necessary to do this in all cases. But, sometimes the program may execute too fast for XB:BUG to literally catch what you want to examine.

Change: This allows you to change the value of any numeric variable. You first have to invoke a V or A commands.

Data: This gives the line number from which the next READ will get its DATA and also shows the next actual DATA item that will be read.

Files: Lists the unit number and device name associatted with each open file. The "mode" of the file was opened in is also given. Input, update, append, or output. Any data in the I/O buffer will be displayed.

Graphics: This item gives you information on 3 items. 1) Character definitions. 2> Color Definitions, and 3> Sprite status. You can earnipulate all 3 items.

Kill Sound: This turns off the sound chip. You will like this after going back and forth from XB:BUC and XB.

List: Will list the program you are working on. You can set the line numbers you want to list.

Other Variable Space: This item is a beauty. It allows you to inspect variables in the main program AMD also in Subprograms. This one is complicated to explain so read the manual!

Program: This supplies information about your program. Line number executing, ON ERROR line number, and OPTION BASE. Also, On BREAK, and TRACE if they are active.

Quit: Quits XB: BUG.

Subprograms: Lists all defined subprograms.

Trace: This will trace back all pending GDSUB and SIBPROGRAM returns.

Variables: List variables and functions with their current values. If there is an array, it will list the DIM. This also works on Subprograms. ?: Will list a line of valid keystroke commands for XB:BUG.

Math functions: Allows you to perfora simple calculations.

Match Function: Several of the commands in XB:BUG will prompt for a MATCH string. The one thing I will explain about this concerns the manual. It says you can use a wildcard character. Well, the printer made the Asterisk so SMALL you may miss this in the manual! I DID!! The quotation marks and the asterisk combined to make a nice inl blob to my old eyes!!

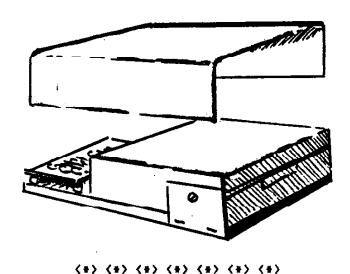

This is all of the commands. The samual documents each command far more than I have here.

In the manual are detailed instructions on how to manipulate some actual code. There are 5 sample files to play with. I would recommend that these are followed through, before attempting to work on a program that you are writing. IB:BUG is NOT a beginners program, it is very powerful and as such has the capability to destroy a program in memory! If this were to happen and you saved the resultant memory to disk.....you may be cussing for a long time! So what GRADE do I give XB:BUG? I have to give it an A in everything except Ease of Use. Why? As I stated above, this program is not for the novice. If they feel they are buying a program that will teach them XB programming or literally do it all for them. They are sadly mistaken.

#### by Chick De Marti

#### KEN HAMAI NIGHT

At this month's meeting we enjoyed athe antics of Ken Hamai. He had a TI disk-drive for sale and to prove that it worked ( also to show how inexpensive (" I'm talking CHEAP!") it can be to put together your own disk drive...HE BUILT ONE RIGHT THERE IN FRONT OF US! He started with a 1x8 piece of wood, with a notch cut out in the back for a recepticle to attach an A/C cord; dressed up the front of the wood with black masking tape, and NAILed a Radio Shack power supply to the back end of the board...(these were kept up inthe air with small pieces of hollow plastic tubeing). He then stapled a piece of cardboad to either side of the disk drive and screwed it to the side of the drive. " We don't want our drive side of the drive. " We don't to move around." he explained. to move around. The explained. He finished the job off by making a cover of "genuine Xerox Cardboard", see drawind, and stapled it to the wood base. Then the moment of truth...will it work? Yes, it did, to the delight (and amazement) of all means. light (and amazement) of all present. It was an entertaining and informative demo, look foward to his next 'performance'.

#### **A\_GUICKIE**

From the Eugene 99/4A User Group come

If FCTN 4 is too much of a stretch, try; (hold down at the same time) FCTN J and spacebar.

It works !"

#### !! S C O O P !!

Those of you who recieve the R.O.M. News- letter, read in the May issue that Ken (
see 'HAMAI's hardware #3 ) is planning to see 'HAMAI's hardware #3 ) is planning to somehow "move the Widget out of the way!". Well, it's done - I SAW IT!

At the L.A.99ers May meeting, he had...not one, but TMO widgets, hooked up in series, setting on the top of of console, just over the keyboard, and truely - OUT OF THE WAY!

A long extention strape would have satisfied most people, but Ken also added a short extention strape to connect his first Widget to one of the ports in the second Widget. Actually allowing 5 cartridges to be made available at the slip of two switches. MAH-VELOUS - simply MAH-VELOUS!

What's next, Ken???

#### <#> <#> <#> <#> <#> <#> <#> <#> <#>

#### THE OLD ONELINE (by John Witte)

This month's "tinygram" comes from the Greater Omaha TI User Grope Newsletter. In XBasic it meets the requirement of being displayed on one screen only... and not a bad little game to boot".

1 CALL CLEAR :: CALL COLOR(10 16,7,2,11,11)::\_B,Q=0;::\_W=I NT(24\*RND)+1 :: FOR T=1 TO 7 1: CALL VCHAR(5-(T>2)-(T=3),T +12,42,VAL(SEG\$("1353352",T,1 2 DISPLAY AT(28,2): "GUESS?": " #1=";R(1);"#2=";R(0) 3 FOR X=1 TO 6 is FOR Y=15 TO 19 :: CALL SOUND(1,+5,8) 4 IF Q=0 THEN P=1+(P=1):: ACC EPT AT(22-P,8)BEEP VALIDATE(" 123456789"):Q 1: B=B+Q 5 CALL HCHAR (6-X, V, 111) :: IF B>W THEN 7 ELSE 0=0-1

6 NEXT Y :: NEXT X 7 DISPLAY AT(21-(P=1),8):"WIN S:" :: R((P=1)+1)=R((P=1)+1)+ 1 11 FOR J=5 TO 12 11 CALL 80 UND (696,440-11\*J,9):: CALL HC HAR(16-J,13,.111.7):: NEXT J :: GOTO 1

(Did You Know ... cont.)

#### YEEP WORKING IQ STAMP QUI SEX

Beginning immediately, all words used in PCAG documents will be sexually neutral. This is in keeping with our policy of designating SIG leaders as Chairpersons and the Mailman as the Mailperson.

Inparticular, reference documents henceforth will be referred to as "person-uals" and archival storage will be called "its-tory files". Use of such terms is an longer ontinual, but merson-datory!

no longer optional, but person-datory!

A committee has been established to ferret out and neuter any additional terms that might slip into Bacon Bits. The committee is headed by V.P. Karen Leeperson.

This important bit of information was gleened from the BIBHUG Newsletter ( I was going to say "page 12"...but in days gone by, a PAGE was a young boy!)...sorry 'bout that.

#### SLASHED\_ZERO

From "on the back burner" by Jean Wilcox (seen in the SUNCOAST BEEPER), if your printer doesn't have a slached zero in TI-writer, use this translit- gring command:

Ti. 48:48,8,47

It prints your normal zero (CHR\$(48)), then backspaces (CHR\$(8)) and then prints a slash (CHR\$(47)) over the existing zero. Slashing zeros in dates or zip codes for your letters serves no purpose whatsoever.

#### AN INTERESTING FORMULA"

10 PRINT "Enter your score a and their score"
20 INPUT "(seperated by a comma)":YS,TS
30 W=W+ABS(YS>TS)
40 L=L+ABS(TS>YS)
50 PRINT "Wins=";
W,"Loses=";L
60 PRINT
65 CT=CT+1 :: IF CT=3 THEN END
70 GOTO 20

Line 65 is an afterthought.

By the way, for the complete version of Ken Hamai's 'How to' project, it is included else-where in this newsletter.

Chick

#### THE IRS AND "WORKING AT HOME"

I am semiretired and do some of my work at home...which poses the problem, "what about the IRS?"Rules regarding deductions of home office costs, depreciation of equiptment, etc. can be found in various IRS publications. None of them too clear except to warn you, "it ain't covered!" Some of the rules regarding "The portion of home office expences states, the home needs to be used exclusively on a regular basis for business purposes. The home office must be the 'principal place of business'. The use of the home office must be for the convenience of the employer". How many of those who bring home work, to help the boss, to catch, etc. fit all these rules? Also there are rules that office equiptment cannot be (usually) depreciated over a period of less then five years. Any person who owns a computer knows his gear is obsolete WHEN HE BUYS IT!

The IRS should reconoze the facts of life and allow some reasonible, fair breaks to those of us working at home. I'll bet those portable computers the IRS bought for their staff will be long gone and replaced when that five-year peoiod is up. What is good for the goose should be good for the gander also.

How about another "DISPLAY AT" program that is written in BASIC? This one does it frontwards and backwards ... W O W !!!

10 CALL CLEAR 28 PRINT "Enter a sentence" 30 INPUT MSG\$ 40 INPUT "(F)oward or (B)ack wards?":DIR\$ 50 L=LEN(MS6\$) 68 IF DIR\$="F" OR DIR\$="f" T **HEN 148** 70 J=(28-L)/2+L 80 FOR I=L TO I STEP-1 90 J=J-1 100 X=ASC(SEG\$(MSG\$, I, 1)) 110 CALL HCHAR (12, J, X, 1) 120 NEXT I 138 GOTO 198 148 J=(28-L)-2 150 FOR COL=1 TO L 160 X=ASC(SEG\$(MSG\$,COL,1)) 170 CALL HCHAR(12, J+COL, X, 1) 180 NEXT COL 190 PRINT 200 INPUT "Another (Y/N) ":Y 218 IF Y\$="Y" OR Y\$="y" THE N 10 220 END

Well...I'm out of coffee see you next month ...

Chick

red and all the rest	white. You do this hy

### FLIP FLOP

This little game of "Flip-Flop" test your patience. When you run the will program you will be presented with a square divided into nine small connected squares, one or more of which will be white and the rest red. Your job is to change the colors so that finally you have the center square

red and all the rest white. You do this by pressing the number of any white square and the ajacent colors will flip from white to red or vice-versa. There is a scoring area that keeps track of the number of times you hit the keys and another area that records the shortest time for a player. I did it once in 17 tries but have not come anywhere near that on subsequent games.

#### HAMAI'S hard WARE #5

#### \*\*\*WARNING\*\*\*WARNING\*\*\*

This project requires some skills and knowledge in electronics assembly. Incorrect assembly could result in burning up your disk drive. If you are not sure how to connect the parts, contact me or somebody who can help. In any event, neither I or the ROM will cover you for any damages or losses resulting from the use of this power supply as suggested by this article and you are using it solely at your own risk.

This power supply was only tested with the Shugart 400, 400L and 450 disk drives. These drives have a low power requirement and as a result work well with this supply. Disk drives which require stronger power supplies will not work.

#### PARTS LIST

- 1. Radio Shack 277-1016 power supply chassis
- 2. Radio Shack 273-1511 12.6volt, 3amp transformer
- 1/2 amp fuse and holder
- 4. SPST bat switch
- 5. 5 ft. of lamp cord and plug
- 6. Three 6 inch lengths of 20-22ga stranded wire, different colors
- 7. Male plug for disk drive power connector
- Small piece of heat shrink tubing 1/16th inch size

All of the above items except for item 7 are available at Radio Shack stores. The disk drive connector plug is available from R&D Electronic Supply, 100 E. Orangethrope Ave. Anaheim, CA 92501.

If you plan to use the same thing I used on the demo, then you will need to have a TI computer transformer. If you have the TI transformer then you would not need to purchase items 2, 3, 4, and 5 on the parts list.

When you purchase the power board, you will note that it comes with instructions on a suggested wiring These instructions also scheme. the use of an isvolt recommend transformer and 2amp fuse. The reason 1 recommend the other transformer is because the power supply does not have to work so hard to regulate the output voltages and the lower amperage fuse gives quicker response to an overload. An added plus is that the 12.6volt transformer costs less.

Step 1. - See fig. 1 for suggested hookup for the transformer and the power supply. You will note this is the same as shown in the Radio Shack diagram. I have included some notes for clarity.

Step 2. - Double check your connections and then plug in your supply to an outlet to test it out. Be sure to turn on the power supply switch located on the board (see fig. 3). Using a suitable volt meter and fig. 2, check that you get the indicated output voltages when you test the +5 and +12 pins and ground. The voltages MUST be pretty close. DO NOT use the power supply if you find it is off by 1/2 volt or more, especially on the +5 volt pin. If the voltages are way off, I suggest you return the board and get another ODG.

Step 3. - Disconnect the power to the supply and carefully bend the -5 volt pin out of the way or cut it completely off. Then solder one of the 6 inch lengths of 20-22ga wire to each of the remaining pins. Use a piece of heat shrink tubing over each soldered connection for insulation. Use yours or a friend's blow dryer at the High setting to shrink the tubing.

Step 4. - Referring to fig. 4, assemble the three wires you soldered to the pins into the power connector for the disk drive. Double check your wiring and test the connector with your voltmeter to be sure that you have the wires in the correct socket positions.

That's all there is to the wiring. If you connected up your disk drive now, it should work.

One more thing, I have not included plans for a cabinet for the disk drive and power supply. You will need to build one to hold your components together. For my demo model, I used the TI computer power supply transformer and eliminated the extra transformer, fuse, switch and lamp cord. And mounted the disk drive to a piece of plywood and covered the whole thing with a cardboard to keep the fingers and dust out. I suggest you take your own measurements for the design of the cabinet. See fig. 5 for a suggested configuration.

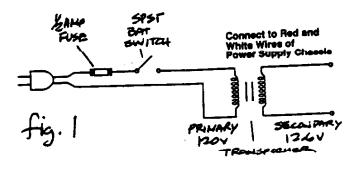

Using the above and one of the T1/Shugart 400L disk drives you should be able to set up a second or third disk drive drive for your system AND this power supply for less than \$40.00, including the cardboard and nails.

Bye for now. Be especially careful out there and tell them all you saw it FIRST!...in the ROM...Ken H.

### ASSEMBLY DISK CATALOG, REVISION FOR HARD DISK

#### by Tom Freeman

In April, 1987 I published source code for an assembly language catalog routine that worked on interrupts. At that time I premised a version for hard disk controllers — and here it is! In order not to bore you too auch, I have changed quite a number of the routines, in addition to adding the code for the hard disk. There are a number of new "bells and whistles," and I have tried to indicate those lines which are changed and which are new, so that if you wish you may add the code for the bells without the hard disk code.

The following features have been added: 1) scrolling up and down line by line as well as by page, using the FCTN X and FCTN E keys, (but the scroll will not go beyond the end or the beginning, whereas the page scroll is circular) 2) auto repeat if you hold down one the four active keys for about one second (but the scroll is auch faster for lines, 3/60 sec rather than 24/60 sec for pages, so you can stop in time) 3) only as much VDP memory is cleared as is needed for the number of pages used, leaving less chance of wiping out strings (in XB) or program (in E/A Basic) 4) if you forget to add the period at the end of the device name, the program will add it for you, 3) you may enter just a drive number and the program will convert it to "DSKx." for you, and 6) a running count is kept of the number of files (plus

subdirectories in the case of a hard disk) near the top of the screen.

This program makes use of the CFI (convert floating point to interger) routine in the console rather than the CSN (convert string to number) as I felt it worked a little faster. I use my own routine to convert to ASCII.

Some additional bits of information. An error crept into the 3rd paragraph of the previous article — all 8 bytes of the floating point number are significant. Unused places sust be >80. However ZERO itself is represented by >80,>80 and the other 6 bytes are undefined. Also please note that the code for the Hard Disk directory is based on MYARC's present Personality Card, which lists subdirectories first, and then files beginning in "record" 115. There is a rumor that this may be switched in their new combined floppy/hard disk controller when it is released. If so it should be simple to make the switch of the two text lines representing files and subdirectories, and if the record number is changed, that is also easily modified.

Good luck, sorry it is so long - writing compact code is not yet my strength!

#### REMINISCING

As one of the early owners of a TI 99/4(without the A), I hope you forgive me if I flash back to those early days from time to time.

At the time I bought my first TI computer. little was available in the way of software. Hy first module was Chess(\$70) followed by the only available game(Video Games). As no third party software at all existed, the only way to really make use of the machine was to write your own code. This was a blessing in that we non programmer types learned how to program out of necessity. In my case, I wrote a number of games primarily to show my two some that I had truly purchased a useful machine. One of my sons asked(challenged) me to write a game similar to Breakout. He showed me the game at a local arcade, running at blinding speed. As Extended Basic had not yet been released, all we pickeers had was console Basic, there was no way to even remotely approximate Breakcut. I told ay son he would have to wait for the announced XB with its sprites. When XB finally was released, it did not take long to discover the real time sprite cooincidence problem. When using CALL COINC. a hit results only when coincidence occurs while CALL COINC is executing. Tight loops and large tolerances were the order of the day. Games had to be "invented" which could work under the existing environment. Breakout, of course, was out of the question. II had already announced another gadget, the MINIMEM module which would allow programming at the assembly level so attempts at Breakout type arcade games was pushed aside until the release of MiniMen. In the meantime several third party companies started producing software. One which immediately gained great popularity was Millers Graphics whose early games were far superior to anything available in Extended Basic. What Miller did, and which still impresses me today, was relatively simple (most elegant, creative ideas are simple). In dealing with the sprite coincidence problem, Craig Miller rather than try to attempt to deal with the problem by conventional means, tight loops and wide tolerances, instead, predicted whether collisions would occur. This was a simple problem in physics, in general, and was done quite rapidly using simple equations. The trajectory was then simulated after the path and collisions were determined. Such a simple idea yet so elegant. This technique and many others which were created by Craig Hiller appeared in Millers Sprite Guide which, to this day, is a classic and a must for all programmers in Extended Basic on the TI 99/4(and 4A).

Following the Sprite Guide, Craig started the Smart Programmer which was a source of unique ideas and the results of his probing into the hidden corners of the machine. Late arriving users know Miller Graphics (now MG) as a source of several fine products and excellent programs but I am sure many cannot understand the respect and gratitude felt by we the early users who lived through those days in the software/information desert.

FORTH BITS 6.... On Changing FORTH Definitions

You may want to look over chapter nine in Starting Forth. I will briefly summarize a few of the salient features of the language as they apply to this subject.

FURTH words are made up of several fields. The name field contains the name of the word. 31 characters can be used in TI FORTH. Next in order is the Link field which contains the address of the name field (NFA) of the previous word in the dictionary. The dictionary thus is a linked list. Next is the code field which contains an address to start execution in run time for different word types. All higher level FORTH words, in TI FORTH, contain the address -7000(Hex), All Variables the address -4616, and constants -45DE. Words in machine code have unique addresses which indicate the location of the start of execution. Last is the Parameter field which, in the case of words of which we are concerned(higher level FORTH definitions), contain a sequence of addresses of the words in the definition which are to be executed. The last word in a Parameter field is always -SBBA which is the exit routine (coopiled by ;). The FORTH interpreter is an encless loop which takes the next word in the input siream, searches the linked list comprising the dictionary from the last entry backwards, and causes execution of the word required. If the word is not found in the dictionary, and it is not a number, an error eessage is returned.

Why would one wish to change a FORTH definition? Some definitions one cannot change with impunity. Suppose one tried to change a definition such as +. This is used in so many other words in the language that a little reflection should convince you that the language is bound to crash should one attempt such a change. Modifying words should be restricted to definitions in higher level words which you have defined in applications and which are modified temporarily while in the process of debugging, as an alternate to changing the code and recompiling. I have found this ability to be quite a time saver.

If one compiles the word : + -; subsequent entries such as I i + . will result in 9 rather than 1. Great to confuse your friends but you have not changed the FORTH word +. The interpreter searches from the top of the dictionary and encounters the new definition for + and executes its code which is -. The interpreter thus never reaches the original word + but all words using + prior to this new definition have alreay compiled the address of the code for the original +. If this were not so there would be havec as all definitions using + would be incorrect. Can you rigure out how to redefine - to be equal to the old + after + has already been redefined? Obviously :- +; won't work as + has been redefined prior to the new definition and - will still equal -. One answer is at the end of this column.

Two methods of changing definitions come to mind. In the first method a new word is defined and then substituted for the old word by modifying the links in the link list. Thus if there were a sequence of words NI N2 N3, and the

<PAGE 20>

word to be changed was WE, the link field of word 3 would be changed to point to the name field of WE and the link field of W2 made to point to the name field of W1. This method while apparently straightforward has a few pitfalls. Suppose that one first changes the W3 link field to point to the new defintion which is also maked W2. This is readily accomplished with the aid of ' (tick) which returns PFA(Parameter field address) to the stack and with LFA(Link field address), and NFA(name field address) which with PFA on the stack return LFA and NFA respectively. Thus ' W1 NFA ' N2 LFA ! links the new W2 to the old W1. The only problem is that the interpreter now bypasses all previously defined words between W1 and the new W2 including W3. If on the other hand, one executes ' N2 NFA ' N3 LFA !, then a loop is created where interpreter executes words from new W2 down to M3 which them points back to new M8. No words below MS can be executed and control of FORTH is lost. One way around the problem is to determine and record the value of MS LFA prior to linking M2 to M1. After linking M2 to MI execute ' M2 NFA ' (recorded value) ! . This method is a bit cumbersome but can be used to modify any word even machine code words in the kernel(not recommended).

Another method usually easier to apply, is to move the words at the new word PFA to the old word PFA. At first glance it would seem that one would need determine how

many words to move by checking for the occurence of -5BBA (the code word for the exit routine) in the words following PFA. Thus a sequence such as 'NEMMORD @ . 'NEMMORD 2+ @ . etc until -5BBA followed by 'NEMMORD 'NEMMORD 'NEMMORD (number of Bytes to move) CMOVE would accomplish the change. All previous code would now point to the new code. The word NEMMORD must be left in the vocabulary. This idea can be greatly simplified by simply defining a new temporary word: TEMP NEMMORD; The PFA for this new word contains only two words. First a word pointing to NEMMORD followed by the pointer to the exit code. After moving this code to OLDMORD, it may be forgotten. It has the midded advantage of allowing the code for NEMMORD to be longer than the code for which it is substituted.

Thus to change a word simply do the following. Write a new definition: NEWWORD (type in your new code here); Now create a temporary word: TEMP NEWWORD; Execute! TEMP 'OLDWORD 4 CHOWE FORGET TEMP and the job is done. This procedure is often a lot faster, during debugging, than recompiling many screens. Of course when the debugging job is completed you would then go back and change code by more traditional means.

By now you probably see that one answer to the question about - is simply to define a word : TEMP + ; PRIOR to the following : + - ; : - TEMP ;

#### FEST-WEST

by Peter Hoddie, (C)opyright 1987

A Report on the LA Show (and some Random Thoughts) May 25, 1987 2:93 AM May be reprinted with full credit

This file is intended as a report on Fest West, the TI computer show held in Los Angeles on May 16 and 17. The show was held at "The Shrine" in LA as part of a larger computer show. The main floor was occupied by all sorts of computer dealers selling mostly IBM stuff and accessories. The balcony was shared with Amiga taking one side and the TI 99 taking the other. Because the show was part of a larger event TI owners had an opportunity to see how the other half lives, while all those with PC's could see what they eissed out on. Attendence at the TI portion of the show was difficult to gauge because of the large numbers of people mandering in who didn't own TI's. A reasonable guess would be between 400 and 500 people. The show was run by the LA 99'ers, and coordinated by Terrie Masters, former president of the group, now vice-president. Rumor has it that the snow may be in Las Vegas neut year.

MG (formerly Millers Graphics) was there in full force selling their many fine 99/4A programs as well as showing their interesting Turbo XT which is being marketed by Triton. The XT uses the TI keyboard, and because of the limited number of keys on the 4A, the largest keyboard strip (I think it has \_4\_ levels) I have ever seen comes with the XT. MG was also showing Super Extended BASIC which is an upgrade to TI's Extended BASIC which is being

handled by Triton. Super Extended BASIC is based on the Danny Michael modifications that appear in GRAM Kracker Utilities I along with a number of new CALLs added by Mike Dodd. I believe the cartridge is selling for \$60, and if you don't have a bRAM Kracker (so you can use 6K Utilities I) I would strongly recommend that you consider purchasing a copy - the new editing and line moving capabilities are worth the price alone. M6 was also promoting their VID program which is a video tape database program for PC's. It is quite a good program, as one would expect from MG, but since it is for \_those\_computers I won't go into any more detail.

Bytemaster, represented by Richard Mitchell, was in attendance. Bytemaster used to publish Super 99 Honthly and now publishes the Smart Programmer, the premier publication for anyone who programs on the 4A. It features articles by Richard, Mike Dodd, Craig Miller, Doug Marren, Mariusz Stanczak, and many others. such as SRAM Kracker and Forth which don't receive auch attention elsewhere are given regular treatment here. Smart Programmer has been behind schedule as of late, but Richard is working hard to get back on track, and the quality of every issue has been outstanding. Bytemaster. has recently gotten into software as well. In addition to the 2 disk set, "Best of Super 99 Monthly," they are preparing to release a package called String Master which is a must for the Extended BASIC programmer who works regularly with string arrays. Bytemaster is now distributing Doug Warren's extraordinary Explorer

program, which was formerly carried by MG. The program now comes on 4 flippies, and is unprotected. There are versions for GRAM Kracker, Extended BASIC, and Editor/Assembler. The complete manual is on disk. I might add that the program is mostly Geneve compatible as well. It is still \$25, and well worth it, to have a version of the program to put on your utility disk.

DataBioTics was there, represented by Bill Moseid. They were showing many of their programs, many of which I had never seen before. They have a version of Forth called Super Forth which was worked on by Edgar Doheann (of Super Bug fame). It is a very fast, well documented version of Forth, that among other things supports a Minchester hard disk. It requires the use of a "super cartridge" such as DataBioTics' Super Space to work, and as such is available provides the Forth programmer with more room to work. They were also showing the shell of a program called SAM (that stands for something but I can't remember the details now). The program is a complete disk manager, including support for a hard drive. The program will be written in 166% assembly and can be used with both the old MYARC personality card (with new EPROMs) and the new MYARC hard drive controller. This program should prove to be quite popular because the utilities supplied with the MYARC hard disk are written in a combination of Extended BASIC and assembly and are extremely slow and painful to use. They were also showing Todd Kaplan's new WordWrite program which is a complete rewrite of the TI-Writer editor with many nice features including more memory. The program fits in a cartridge, which can include a built in printer port, and can use a cassette to load and save files. If you know anyone with a bare bones II system looking for a word processing program, this is the only serious choice.

Dijit Systems was at the show, demonstrating their analog and TTL RGB display conversion kits for the 4A. These go for about \$100 and let you use a high quality display with your 4A. I suspect the analog option may become quite popular as more people buy analog aonitors to use with their Geneve. Dijit was also showing a prototype of a video card they are working on. This card allows for 80 columns, and is based around the 9938 chip that is used in the Geneve. It should be available in the next couple aonths for around \$200. From what I've seen, it looks to be a better supported product than the 80 column card from Mechatronics.

A little known company by the name of Pesaca came down from San Francisco to show their programs. Charflat and Print Designer are their two current offerings and both are well documented, full featured, graphics type programs. Their main pitfall is that they only work with certain printers (although Tom Freeman and I didn't have much trouble in converting some of the programs to run on an Epson compatible) and they are a bit pricey. If you have one of the printers that is supported, I strongly recommend these programs. Details can be found in the last few issues of MICROpendium.

MYARC was present as represented by their west coast distributor Les Merryman. Since Lou Phillips was up at the Ottawa show, I (jph) was sent out there by MYARC to represent the company. Mostly we showed the Geneve 9648

and answered questions. The computer was very well received and all ten units that were available for sale at the show were sold. During the two days of the show many people brought over disks of programs that they wished to try out, and in over YDZ of the cases the programs worked flawlessly. This made for the best deso because the people were 199% sure that nothing was rigged. They were seeing that this machine was compatible with their beloved 4A. I would dwell sore on the subject of the 964%, except I think that we all know the details by now.

Since I was going to the show, I also dragged along products from Genial Computerware, Tigercub, Boston Computer Society, and the MAGNETIC user group. Tigercub had Nuts and Boits 3 available as well as Tips from the Tigercub 4 and these sold well. The Boston Computer Society was selling disks from its popular software library and copies of Joyce Corker's excellent TI Writer Tips and Tricks booklet. Magnetic was selling laminated Ganial Computerware was selling keyboard strips. subscriptions to volumes one and two of Barry Traver's incredible Genial Traveler diskazine, as well as XBasher by Mike Dodd, and XB: Bug, GRAM Packer, and the Horizon RAM Disk EPROM by me. Watch for reviews of these product in MICROpendium over the next couple months. I would say more, but then this would turn into an advertisement.

T.A.P.E. was there selling the Machatronics product line including a very affordable EPROM programmer at about \$149, the excellent Intern book by Heiner Martin, an 89 column card, a semory expansion for the their ERAM Karte (sort of a GRAM Kracker in a box), and the very popular "I (heart) My TI" baseball caps that Disk Only Software made famous at the Chicago show this past suggest.

Rave 99 came in all the way from Connecticut and sold quite a number of their keyboards which allow you to use an IBM style keyboard with your 4A. They also now offer the product in kit form and without the keyboard for those who may already have an IBM type keyboard (such as 9640 purchasers). They were also showing their card which allows the speech synthesizer to be placed inside the expansion box for convenience on the 4A and required if you want speech with the Geneve. They were also quietly discussing some rather exciting future plans. Keep an eye on Rave 99; they are turning out high quality hardware products for the 4A.

There was a fairware booth, where you could get copies of all the latest fairware programs and make a contribution to the author on the spot. They were also selling a listing of nearly 260 fairware offerings for only a dollar. The table was run by Steve Mehr who did a greatiob in producing the list, and Ken Gilliland who has created some of the most incredible music programs ever written for the 4A. If you haven't heard (and seen) any of Ken's work send him a few bucks and some disks to the address below for some incredible material. He has done disks from Star Trek, The Wizard of Oz, South Pacific, Patsy Cline, Richard Wagner and more.

The LA group was preciering their new "Kracker Facts" book edited by Mike Dodd which contains page after page of useful information for GRAM Kracker owners. The saterial is by Mike, Tom Freeman, Craig Miller, Walt Howe, and others. It is available for \$5 (and I suspect \$1 for postage). They also were selling Tom Freeman's booklet and utility disk compilation of his incredible articles from the LA newsletter. The set is \$8 and well work it.

There were a good number of local user groups with displays at the show, selling from their software libraries, but since I don't have a complete list I will refrain from listing them.

Because of space, I can't possibly write a paragraph about every person that was there, I as now going to name drop and just list the names of some of the many people who I met there. Too Freenan, author of DISKASSEMBLER and president of the LA group; George Steffan, former vice-president of the LA group; George Steffan, former vice-president of the LA group; and resident guru; Doug Marren, creator of Explorer; Bill Harms, author of Fas-Trans; Rodger Merritt, author of Print-It, the fairware alternative to Font Writer (gasp); Ray Kazmer, author of several fairware programs; Joe Muovolini, president, I believe, of the Colorado Springs user group; Maruisz Stanczak, author of the Forth column in the Smart Programer; Fred Moore, software librarian for the LA 99'ers.

The show was a lot of fun. That is the true bottom line. Friday and Saturday nights the LA group sponsored a hospitality room at the hotel, and a wonderful time was had by all. The best part of the show was meeting people — old and new friends. That is what this community is in a large part about. It has to be. Without a huge company looming over us to protect and provide for us, we have to stick together. This show was a success because of the spirit of the people who organized it, who came to display their products at it, and who came to see what is still available for their 4A computer.

A special thanks to Terrie Masters, Tom Freeman, and George Steffan for driving me around, giving me a place to stay, and in general making my stay in LA a wonderful time.

H

And while I have your attention I would just like to make a few completely unrelated comments. In answer to the most popular question of the show when will the Geneva be shipping." I can only say "real soon now." Actually sometime in the next week or two. So they tell me. And in answer to the second most popular question of the show "when will Funt Writer II be shipping," I can only say that I plan to start clean up work on it as soon as I finish this file, so about 2 weeks, assuming I get that gate array from Mitsubishi . . . who got Genial Traveler volume 1 number 6, and the John Calvin Traver disk that came with it, the Sort Experiment program on there by me doesn't work. It was sort of a combined foul up by Barry and syself. The corrected files are available on CompuServe and OEnie, and will be sent out with the next issue of Traveler. If you want them, or are not a Traveler subsecriber and are looking for a very fast assembly language sort, that can handle any file type, up to 1839 records or 24K of data, ascending or descending sorts, on up to eight fields, send a disk and return mailer with postage to the address below. or \$3 (to cover the above, that \$3 is not the requested fairware donation) to me at the above address. Complete source file are included. Thanks for reading this file, your eyes must be pretty tired by now. I know my fingers are. -iph

EPostscript by BAT, who was at Ottawa instead: Actually, the SURT program sent with GT #6 \_does\_ work. The minor bug (discovered by Tom Freeman) was that it could only handle single-digit entries for starting character entries (e.g., you could tell it to sort beginning at character 6, but not character 16, since it would ignore the first digit). The fix in the source code is a simple one. In line 721 of DSK1.SORT/EXP/S, you'll find this:

MPY 4015,R1 multiply current value times 10

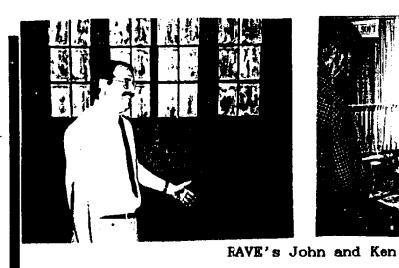

Before that line, insert the following short line:

MOV R2.R1 Thanks you, Tos Freesan!!!!!

In other words, your source code for SORT/EXP/S should now look like this:

9721 MOV R2,R1 Thank you Tom Freeman!!!!! 9722 MPY 8019,R1 multiply current value times 19

Ny mistake was omitting to include the program image file in SORT/ARC, but you'll have to reassemble it anyway. Here are the steps: (1) Assemble (the corrected) SORT/EXP/S to create SORT, (2) assemble SAVE/S to create SAVE, (3) Load SORT and SAVE into the Editor/Assemble option 3, linking to program name SAVE. That's all there is to it to create an all-a/l sort program to sort essentially any type of disk file (e.g., DVBS, IF2S, etc.) on up to eight fields, thus providing a sort program with much greater speed and flexibility than you may be accustomed to! Try it - you'll love it!

### MODEL 997105 KEYBOARD ENHANCEMENT

\$199.95

医巴巴氏氏检验检医氏性检查性检验检验 4 5 4 15 ¥ . 2 백 등 분

S CHAROLIN HO TO CHICL

THE FOLLOWING ARE STANDARD FEATURES ON THE MODEL 99/105 KEYBOARD ENHANCEMENT...

- \* INTERFACE LOGIC CARD WHICH INSTALLS EASILY IN CONSOLE WITHOUT SOLDERING.
- \* 105 KEY KEYBOARD WITH 24 FUNCTION KEYS.
- \* SUPPORTS SINGLE KEY ENTRY OF ALL TI-WRITER, MULTIPLAN. AND EDITOR/ASSEMBLER COMMANDS.
- \* ATTRACTIVE LOW PROFILE KEYBOARD WITH ADJUSTABLE TILT ANGLE AND 5 FT. CORD.
- \* DEDICATED NUMERIC KEYPAD WITH NUMERIC OPERATORS.

STELL

- \* \* DEDICATED CURSOR CONTROL KEYS.

  \* \* ENLARGED RETURN, SHIFT, AND CONTROL KEYS.

  \* OPTIONAL USER INSTALLED RESET AND LOAD INTERRUPT CAPABILITY FROM KEYBOARD.
- \* \* DETAILED INSTALLATION AND OPERATING INSTRUCTION MANUAL INCLUDED.

#### KEYBOARD INTERFACE CARD

- Interface card installs in 4A console in place of old keyboard and allows use of any IBM PC/XT compatible keyboard with your 99/4A. Interface card supports all 83 standard PC/XT key codes.
- \* Comes with complete. easy to follow installation and operating instructions. NO SOLDERING REQUIRED.
- Optional user installed RESET and LOAD INTERRUPT capability from keyboard. Complete instructions included.

#### KIT AVAILABLE

- \* Includes printed circuit board, complete instruction manual, and RAVE 99 custom chips. Hard to find hardware also included. Requires only assembly \$ 92.00 and about \$10.00 in easy to find components to complete.
  - → IBM & P.C./XT are trademarks of International Susiness Machines

- ... I wonder how I have managed all this time ... no longer have to go through those awful contortions... an absolute juy!: D.R. Harrisburg, PA.
- .. the keyboard is everything you said and more...performs exactly as advertized...has operated flawlessly. J. C. Worthington, OH.
- .. I would hate to go back to the original J. L. Hicksville, MY.
- ..having trouble restraining myself... nothing but superlatives.. I have stepped up to big time computing.  $\,$  J. W. Englewood, OH.
- .. this keyboard is fantastic !! M.H. Colonge, West Germany
- .. I played, I explored, I fell in love...by Gawd there is a Santa Clause. This thing is GREAT! .. absolutly no problem instabling it. M.M. Tempe, AZ.

#### NEW PROGRAMS FOR JUNE

- 4129 ARCHIVER \$2 Freeware by Barry Boone Compatible with 4104 ARCHIVER #1, and seems to be a little faster. ARCLOAD is the loader. (SSSD)30
- 4130 **LINKER** Freeware by R.A.Green. A tool for building assembler language memory image programs from tagged object. It makes this process simple and straight forward. (SSSD)233
- 4131 **DISK LABELS** Freeware by Dennis Porpora. Prints: 1 or 2 disk catalog side by side. Print disk catalog on Avery labels up to 70 files. Prints a labels for both side of a disk. prints an index card and an address label. )SSSD)284
- 4132 **CHAINLINK** Freeware by Walter Howe. This is an excellent solitare game using entire deck of 52 cards. A unique (to me) version of solitare that actually requires a little cogitation to beat it...you have to look at several moves in the future, like chess. Send him a ss/sd disk, mailer, postage, and a reasonable cash contribution if it appeals to you.
- 4133 **SUPERDIAL** Freeware by Roger Davis. Use with Fast-Term (on disk). 3 functions 1. PC PURSUIT DIALER. 2. LOCAL DIALING. 3 VOICE DIALING and BBS connection. (SSSD)310
- 4134 **PRO 99 BBS** Freeware by Mark Hoogendoorn. Improved by Roger Davis. This is a TI BBS with true TE2 transfer capabilities. Instruction on setting up and running 99 BBS system. (SSSD)342.
- 4135 GRAPHIC LABELER /// Steve McWatty RR#1 Kinburn, ONT KOA 2H0 CANADA. To use Graphic use Dave Rose characters set. Prints 5 roll label with 1st line double emphasied, auto center (SSSD) 63
- 4136 **DISK MACKER** /// Will McGovern /// 215 Grinsell St. Kotara, NSW 2289 AUSTRALIA -TI Controller only- A powerful disk utility to examine the actual format of each track of a disk. Single or double sided. Olso has cassete and A/E program loader. (SSSD)217

#### LIBRARIAN FRED MOORE 7730 EMERSON AVE. LOS ANGELES CA 90045

The LA-F E A S T-WEST by the Pomona User Group sec., Bill Haras

The second annual southwestern United States TI Home Computer FEAST really was a feast: of friendly folks helping others, of hardware, software, firmware (both new and used).

The LA User Group sure brought out a lot of TI enthusiasts for a well attended two days of questions and answers, demos, displays of all sorts of neat new, sore powerful hardware and software.

Having a booth at the feast was well worth the fee and effort. It was nice to support the TI Home Computer community. We were able to hand out several fliers about our Pomona club and answer questions and sell used items. Plus, we got to talk with lots of famous persons, who have invented software, hardware, firmware and/or have

promoted the TI-99/4A user interests.

The LA group sure put-in the power with Fred Moore furiously copying library software from their hugh library and Terrie Masters, George Steffen, Tom Freeman and Gail -?- all working hard, and esp. those two folks processing the registrations and raffle tickets. Boy were they all busy. I was even lucky enough to win the 2nd prize, an Oscar, which is a bar code reader device for quick entry of basic programs!

Speaking for the Posona club, it was a smashing success, esp. since a truck broke the big entrance door Sunday PM. We even found a 2nd table for the club booth on Sunday AM on which to display all the stuff we had available.

It was a valuable get-together for active TI computerists and others who might be interested in using a TI.

<PAGE 29>

England Utilities programs from 14 UTILITY #1 \$5.00 sprite), CHARPAT(define all 2039 keys), -BASIC SPIRTS. CHDEF(draw CHARMERGE (charpat in merge format), CHARSAMPLE (demo of charpat), CHECKLIST(find any variable), CURFLIP(alter cursor to show color), ART, HEXDECHEX(converts Hex to Decimal and vice-versa), MM>DSK(load programs into Mimi Memory from disk), DISPLAY-AT(useing TI Writer to create a blank screen), PILOT/INST(brief instrction for "Pilot"), QUICK-SORT(add to existing file for sorting), PROG/CHKR(compare 2 program listing), REMDIVIDER (create 2 new program from your old 1=all/REMS 2= no REMS), SCREEN-MAP(locates and compares screen addresses), SCREENDUMP(dumps anything on screen), STRFILE(relocate assembly programs in memory), KAMIKAZE(game), TINYTIPS(tips for basic programmer), TVTESTCARD(draws test pattern on screen). (SSSD) 329

2032 **UTILITY #2 \$5.00** Use Editor Assembly or Extented Basic. Two popular programs on one disk TI-WRITER and DM-1000. When useing E/A Load and Run DK TI no good CorpComp Controller. (SSSD) 237
